REGULARS**Monitor 2**

Suppliers rally round Oric, page 2; QL users get alternative operating system, page 3; Protek acoustic coupler breaks price barrier, page 4; Acorn and Future take the gloves off, page 5.

PCN Charts 6

Charting the fortunes of your favourite game or micro made easy with our weekly update.

Random Access 9

Readers' letters: an amused view of the Imagine fiasco, and PCN's QL reviewers are hauled over the coals.

Routine Inquiries 10

All the technical know-how of PCN is at your disposal. This week we answer questions on the Amstrad, Commodore 64 and Spectrum printers.

Microwaves 14

This week's bundle of microcomputing tips help Amstrad, BBC, Electron and Spectrum owners.

Readout 16

Another small sample of the vast numbers of micro books available, to help you make a choice.

Software Pre-View 30

Rounding up the latest crop of software packages to arrive at PCN.

Billboard 42

Carrying on the tradition of the bargain basement, pick up a good buy on our second-hand equipment page.

Quit/Datelines 48

Concluding on a lighthearted note, we laugh at our own and other people's foibles and let you know what's on and where.

**COVER STORY****Sweet sixteen 24**

Commodore has decided to try and follow up the enormous success of the Vic 20 by producing a successor. With 16K RAM and general improvements on the Vic—in some ways even on the 64—the C16 is a winner, says Barry Miles.

SPECIALS**Arrayed for action 18**

Arrays are easy to adapt to your needs when writing an adventure program—Ken Garroch shows how it's done.

**Amstrad scrollwork 22**

A set of simple machine code routines will have your Amstrad screen scrolling merrily up and down.

PERIPHERALS**Pen-pal 28**

The Parfitt plotter is much more than just a handy tool for drawing graphs and pictures, as Kenn Garroch discovers.

SOFTWARE**Versatile McVid 32**

Playing around with sprites and graphics on the BBC is easier with the McVid package from Pica Software.

Comprehensible Comal 35

If you've ever wondered how to teach a novice structured programming, here is the answer. Just give them Comal and a Commodore 64.

GAMEPLAY**Commodore 64/ Atari 36**

Some fine contributions for their two machines: a fascinating 3-D space arcade game and a graphic adventure based on the TV series *Dallas*.

Amstrad 37

We've rounded up another collection of well-known games that have been converted for the CPC 464.

PROGRAMS**Atari 800 38**

Another implementation of a famous arcade game, but an exceptionally good one and particularly good value for money.

Creditors rally to Oric

By Ralph Bancroft

Major creditors of cash-starved Oric Products were due to get together this week to work out ways of seeing the company through its current problems (issue 75).

The current cash problems were made more last week when Oric went to court to answer a writ from KMP, its advertising agency, claiming £200,000 in unpaid bills.

This is one of the actions that released the tide of speculation over Oric.

The court threw out a counter claim from Oric that KMP had

provided it with wrongful advice and ordered the company to pay the money it owes along with KMP's legal costs.

It is believed that Oric owes its creditors a total of around £4 million, but not all of them are as anxious as KMP to secure immediate payment.

Assembly and Automation Electronics, the company that manufactures the Atmos, is taking a sympathetic view of Oric's difficulties.

'We are fairly confident that Oric will be able to meet its debts,' said Keith Arnold, A&A's managing

director. 'It is just going through a cash flow problem. There are a lot of orders in hand.'

He confirmed that some of Oric's creditors were meeting to discuss ways of helping Oric out. 'Most creditors are very supportive of Oric,' he said.

Also involved in the discussions is Hitachi, which supplies disk drives and other components to Oric.

Andy Killick, Hitachi's product manager, said that it was 'only a very small creditor' but refused to go into any further detail.

'I would not like to prejudice any

meeting that may take place,' he said.

Industry analysts suggest that Oric's debts are more than covered by value of the property owned by Edenspring Investments, Oric's parent company.

But selling off property assets is something of a drastic measure to meet what may just be short term debts.

A more likely outcome is that Oric's creditors will agree to reschedule the debts so the money will not have to be paid until pre-Christmas sales start to take off.

Tandy makes first cut to cost of book-size portable

Tandy has cut the price of its A4-sized Model 100, the last series of Tandy cuts but possibly the opening shot in a portable price war.

Apart from a short promotion earlier this year, Tandy has held the price of the popular Model 100 steady since its launch last July. But from September 1, the 8K version checks in at £449, down £50, and the 24K model at £579, a reduction of

£70 from the price tag of the last 12 months.

A spokesman said that Model 100 had been: 'an unqualified success from Tandy's point of view', but he added ominously that the price cuts had been prompted by 'a desire to remain competitive in the lap-held market'. Tandy's main competitors, the NEC 8201A and the Olivetti M10, come in at £475 and £499 respectively.

Model 100 — now coming in at £26 less than NEC's 8201A.

Computers deal closer

It looks as though Computers may have found a saviour in printing and stationary multi-national Spicers International.

A spokesman for Computers' liquidator Hacker Young confirmed that talks with Spicers were at an advanced stage, although he declined to comment on what shape a potential deal would take.

Spicers also declined to comment. The director in charge of the negotiations is currently away on his honeymoon.

BBC business prices on roller coaster ride

The Acorn Z80 second processor has jumped £100 in price to £399 — but what you lose on the swings you may gain on the roundabout, because the price of the BBC single disk has come down by £50 to £199 at the same time.

The Z80 board, launched in May (issue 61), comes with various items of bundled software besides CP/M 2.2 and GSX. Is is the cost of supporting this software that has been the main cause of the price increase — for dealers to offer a reasonable service Acorn has had to give them larger margins.

The reduction in the 100K disk drive comes, Acorn says, from more efficient sources of supply and the need to remain competitive. It follows a barely publicised reduction of £105 to the price of the 800K dual disk drive, which now costs £699.

Acorn's Z80 with two disk drives still struggles to be competitive with the Torch Z80 Disk Pack for price — Torch's ZDP240 gives 800K, a Z80, and bundled business software for £805. And for users assembling a business system around a BBC micro there is the further alterna-

tive of the Rade R50 board (issue 76), which lets you pick the software you want. Acorn has no plans at the moment to offer a Z80 unit without the accompanying software.

The Acorn Z80 second processor has been selling 'by the thousand' every month, a company spokesman said. Where the BBC is being used as the hub of a business system Acorn aims to get as close as it can to the mainframe/minicomputer idea of a turnkey system, where you simply set it up, plug in and go.

But CP/M is popular enough to offer its own alternatives.

Acorn muscles in on Torch

By Ralph Bancroft

Acorn is making itself felt at Torch Computers even before its agreed takeover is finalised.

It has replaced Torch's chairman and managing director Bob Gilkes with Peter O'Keefe, Acorn's sales director. Mr O'Keefe will combine the job of chief executive at Torch with his existing position at Acorn.

In a statement from Acorn Mr O'Keefe said that his first task will be 'to give a strong sales-led direction to Torch's management' and 'develop Torch's credibility to enable the firm to capture large market shares.'

This implied criticism of Torch's existing management may go some way to explaining Mr Gilkes' departure. In the usual euphemistic language that these kind of statements are couched in, Acorn says that Mr Gilkes 'has resigned to take up other interests in the computer industry.'

However, sources close to Torch suggest that Mr Gilkes was asked to leave after Acorn complained to Newmarket Venture Capital, Torch's current owners. Acorn was far from pleased with the way that Mr Gilkes signed an exclusive licensing agreement with

Data Technologies to manufacture and market the Graduate IBM-compatible add-on for the BBC micro. This was in conflict with Acorn's plans in the same direction.

In fact, the Graduate is still experiencing teething problems and the latest design change is the addition of a fan to cope with overheating problems.

Acorn was also unhappy with the way that Torch jumped the gun in announcing the takeover plans before they were complete. Officially: 'negotiations are now well advanced for the takeover to be completed.'

Mr O'Keefe's appointment raises more questions than answers as to why Acorn is buying Torch and what it proposes to do with it.

Acorn said in the statement that it expects Torch to provide a 'firm platform' for its thrust into the business market. Yet in an exclusive interview with PCN last month (issue 72), Chris Curry, Acorn's chairman, said that the company was going ahead with its plans to launch a range of business machines of its own this Autumn.

With Torch and Acorn offering competing ranges of business micros something will have to give.

QDOS under fire

A change of heart from GST Computer Systems has given Sinclair QL users a direct alternative to the QDOS operating system.

Originally GST planned to sell its 68K/OS multi-tasking operating system only to micro manufacturers and distributors (issue 67). But the reaction to the 68K/OS has been so good that it has decided to offer it on mail-order to end users.

'We didn't know what the demand was going to be,' said Chris Scheybele, who is in charge of the 68K/OS project at GST. 'After showing it to a number of people including the independent QL user group, we decided to change our mind,' he said.

The operating system comes on a board that plugs into the internal

expansion port of the QL. The board includes two spare 16K EPROM sockets for ROM-based software and a switch to allow the user to select either QDOS or 68K/OS.

It will sell for £99.95.

It offers QL users full multi-tasking, multiple screen windows and device-independent input/output, and it works with bit-mapped graphics. A pipe utility allows you to transfer data from one program to another program running concurrently.

Yet for all its facilities it still squeezes into 32K of EPROM.

GST will be including with the board a tape containing a text editor and file transfer utilities.

GST has also brought out a

version of its 68000 assembler for 68K/OS. Called 68K/ASM it sells for £39.95. Initially software for 68K/OS is likely to be in short supply. GST is working on a word processor which should be ready shortly, to be followed by Pascal and Fortran.

One product that won't be available is a 68K/OS version of Psion's integrated software.

The success of the operating system will depend on the flow of software from third parties but this is unlikely to happen on any significant scale until next year.

A major factor is the negotiations between GST and hardware manufacturers about putting the operating system on soon to be launched 68000-based micros.

IN BRIEF

End of an era?

Evidence is mounting that home micros are coming to the end of their golden age. Following the Gowling report (issue 73), BIS-Pedder's 1984 census of computers detects a 'mounting dissatisfaction among users who want to be more adventurous'.

As a result, the company concludes, you're likely to forsake games micros and not replace them. It describes this as the home computer bubble bursting, a messy prospect that could see sales of carpet cleaners go through the roof.

Commodore's boom

Commodore UK has rounded off the year in which it gained the Royal Warrant by topping £100 million in sales. Around the world Commodore took \$1.27 billion, but 1985 is likely to be tougher with ex-Commodore boss Jack Tramiel drawing the battle lines at Atari.

User group quartet

White Lightning, featured on the cover of PCN issue 74, has attracted enough interest for two user groups to be formed. Occam and Sanyo MBC-550 groups have also been set up in the last two weeks.

The White Lightning groups are at The Model Shop, 10-16 Queen St, Belfast, and Mr M Richards, 8 Victoria Rd, Roche, Cornwall. The Occam User Group's secretary is Dr Michael Poole, Immos Ltd, Whitefriars, Lewins Mead, Bristol BS1 2NP. Sanyo users should contact Tom Drake, 143 Glebe Avenue, Ickenham, Middlesex UB10 8PF.

Aries Rampage

Memory expansion for the BBC comes a little cheaper as a result of Aries Computers' (0233 862614) decision to cut the price of its B20 20K RAM pack.

The expansion pack comes down by more than 30 per cent to £79.95. It coincides with the launch of the B125ideways ROM expansion unit, and also with an uncompromising denunciation by Aries of 'cheap imitations' of the B20.

ACT to IBM swap

New software from Apstor (0273 422512) will let users of IBM, Sirius and Apricot systems interchange data by means of removable cartridge storage devices.

The arrangement applies to Apstor's Beta 5, Alpha 10 and Gamma 20 units.

Century saver

Pocket-money software began as a breakthrough, became a trend, and is now almost standard with the emergence of another company selling games for £1.99.

Century City Software (0384 57077) has launched four Spectrum games at £1.99.

Dawn chorus for Radio 1 Chip Shop

Early risers can look forward to a new series of BBC Radio's Chip Shop, which from September 29 is opening for business on Radio 1 as well as returning on Radio 4.

Unlike normal chip shops the Radio 1 version is on at 7.33 am. A bonus for the bleary-eyed is that it will be graced by PCN's popular Games Charts. The program, presented by David Freeman, will run until about 7.45 am.

Radio 1 will also be broadcasting software in the Basiccode format at

the unearthly hour of 5.55 am every Sunday morning. The BBC has issued an upgraded version called Basiccode 2+, which is now suitable for the Spectrum, MSX range, Electron, Dragon and Oric systems. The Basiccode 2+ kit costs £3.95 from Broadcasting Support Services, 2 Cater Road, Bristol BS13 7TW.

Radio 1 will be inviting you to try your hand at submitting Basiccode programs for transmission — but you should note that since the Dutch originators of Basiccode intended it as a non-profit-making venture, you're not likely to see much in the way of rewards.

The returning Radio 4 Chip Shop, with Barry Norman, starts its new season at 4.15 pm on September 15.

Autumn fall

The Autumn bonanza of new software is upon us again. With new releases from Hewson, Micro-Gen, and announcements from Software Projects, amongst others, September 1984 looks very promising indeed on the software front.

Quicksilver is due to release author Sandy White's follow-up to Ant Attack. The game will be called Zombie Zombie will cost £6.95 and use White's special programming technique to create an illusion of three dimensions.

A version of 'Ant Attack' for the Commodore 64 has been promised for some time and it now looks as if patient 64 owners won't have to wait much longer.

Axe hits Atari 600XL

Jack Tramiel's axe has fallen on the Atari 600XL. Heads have rolled down the corridors of the executive suite since his takeover of Atari — now the product range is suffering its first casualties.

The 600XL is not yet officially discontinued in the UK but a spokesman said last week: 'The main emphasis now is on the 800XL.'

Atari's market research, he said, showed that the market (ie people buying micros) was moving towards 64K machines. 'The 64K 800XL will naturally take precedence over the 600XL, which will continue to be sold while current stocks last.'

The expression 'current stocks' is the death knell for the 600XL. Mr Tramiel, founder of Commodore and now apparently determined to grind the company he founded into the dust, is reported in the US to have discontinued all Atari's home micros with the exception of the 800XL. That machine now costs

£200 in this country.

The 600XL's number came up two weeks ago, when it too came down in price to below £100. Prior to this (issue 74), a London store jumped the gun by offering it at £99.99.

Atari will continue to support the 600XL, and the compatibility within its range will ensure that users aren't left high and dry. They will also have the option of adding the

£90 memory module that effectively turns it into an 800XL.

As to the future, Atari UK has cancelled a press conference at which Jack Tramiel was to have spoken on his view of the company's development. The reason given was that further developments of new products demand his attention in the US — these will be the 8-bit, 16-bit and 32-bit machines that it is said to be working on.

600XL — heading for the last round-up.

VIEW FROM JAPAN

Portables and problems that don't go away

By Serge Powell

I've heard it said that portable micros have no place in serious computing. Not the 28lb Charles Atlas portables, the A4 Epson/Tandy 100/NEC/Olivetti/H-P 110 style.

These lightweight portables, some say (and you can recognise them by the redness around the eyes that comes to anyone who spends any time with their head in the sand), have deficient displays, sparse storage, and few real functions.

The truth, as usual, is a platitude — you don't miss something until it's not there any more, in this case computing power.

There is one undeniable satisfaction about writing for a magazine that appears halfway around the world from where I live, and that is that unless I show it to her there's no likelihood of my wife accidentally coming across my column. So I can confess: during the 12 days I just spent in Pakistan I missed a computer more than I missed my wife and kids.

This may sound heartless, especially as families (under favourable circumstances) can be just as portable as micros. But however strong they may be on moral support wives and offspring come up woefully short in the data processing department. I blame the system designer.

In fact, before I go anywhere again I'm going to make sure I take along a portable with word processing and database software, especially if I travel with a group of 56 reporters, TV production people, various hangers-on, and the stars of the show — a group of Japanese, Korean and US wrestlers staging charity bouts to raise funds for Afghanistani refugees.

And especially if I'm responsible for keeping everybody advised as to their schedules, which for reasons various and sundry broke the 56 down into two large groups, four small, and three of only one person each. All of them spent a lot of time going to different places at the same time.

The inclement weather and an innate Third World inability to treat time, space and the universe on any but a fatalistic, carefree, 'what's everybody getting so excited about' level and numerous other cataclysms required endless and countless changes to the schedules I'd so neatly prepared, personalised and printed back home on my desk-bound micro, schedules that looked like a Race Tote scratch sheet by the end of the trip.

In any case, if I wasn't before, I'm now a firm believer in portable computers, disk drives and printers, and have also had good cause to promise never again to complain when the micro and the rest of the hi-tech stuff I surround myself with performs less than perfectly. I've seen tech at its lowest.

Our group had the not-so-easily arranged privilege (I spoke with one reporter who after three months had still not received a permit) of visiting an Afghanistani refugee camp. Like most chip-heads I admire our more capable fellows who can scrape together electronic bits and pieces to build computers, but my mind is still numb from the sight of people who must scrape together their homes, so low-tech that the building materials are straw and mud, and who must dupe the outsiders with cow-dung so that it will dry faster so that they can use it as fuel, and then live on the 50 cent allowance they receive as refugees (the cost of a Coca-Cola in our hotel).

Now I've got that off my chest, back to the purpose of the column, which is personal computer news. Apparently Air Pakistan has recently modernised its offices by buying some 200 Apples, and has worked out some kind of deal to manufacture or assemble or act as sales agents for Apple in Pakistan.

This may not be big news for you or me, but now that I've seen how the other two-thirds of the world lives I'm in favour of any step forward. Apples as fruit might be more appropriate than micros but who's going to quibble? Micros are working minor miracles everywhere else, why not where miracles are noticeably thin on the ground?

Protek makes modem pitch

With most people buying directly connected modems it seems ambitious to bring out a new acoustically coupled modem.

Protek Computing takes a different view. Its 1200 modem is at £59.95 the cheapest Telecom-approved modem on the market.

Also it thinks there are large numbers of parents out there who would be horrified at the thought of their son or daughter plugging directly into the telephone line.

Protek is likely to find a market too among the growing band of lap-held micro users who want a modem they can carry around with them.

As the name suggests, the 1200 modem is designed to operate at 1200/75 baud, full duplex for connection to Prestel and other computers and for user-to-user communications.

Along with the modem, Protek is selling a range of interface packs for popular micros. These include the software to allow you to access Prestel and to communicate directly with other micro users.

Interface packs for the BBC and the Commodore 64 will cost £14.95, and £24.95 for the Spectrum.

These will be available along with

Protek 1200 — modem à la mode. The modems from around the middle of September in branches of Menzies, WH Smith and Boots.

Additional interface packs for the Atmos, Electron, OL, Amstrad and MSX machines should start appearing by the end of October.

Protek has no plans to release interface packs for the lap-held models. So users of the NEC/201A, Tandy Model 100 and the Olivetti M10 will have to rely on the terminal software that comes with the machine.

These means they will not be able to use the modem at 1200/75 baud.

GRUNT AND GROAN — Grappler fans will be pleased to learn that Orange Micro, doyen of grappling, has released a serial version of its Grappler i-printer interface. For Apple II, II+ and IIe users it includes 25 firmware commands to take care of (among others) high-resolution graphics and 80-column text screen dumps. It can also accept an additional buffer module, Bufferpak, with 16K to 64K of printer memory. No UK prices have been set yet.

Second-hand's hour nears

'Old micros for new' doesn't sound like the most promising sales slogan but there may be more to the second-hand market than meets the eye.

Carston Electronics (01-943 4477) is taking a side-swap at the quality control of the manufacturers at the same time as launching itself on a career in selling second-hand micros. 'One of the less well understood benefits of buying used equipment,' it says, 'is that, when properly maintained, it is often more reliable than brand-new.'

The company, previously specialising in refurbished test instrumentation and equipment, is moving into used computers and peripherals. The smallest system it will handle will be about the level of the Apple II series, and its prices

(depending on the quality of the system) could be 50 per cent below the cost of a new machine.

For the sake of buyers' peace of mind it promises to test, re-condition and guarantee used equipment to operate 'as new'. 'We're not too impressed with manufacturers' quality control,' said a spokesman, hinting that the performance of its kit might in some cases be better than brand-new equipment.

With other companies, Carston is opening a second front in the price war.

There are also organisations planning auctions of used computer equipment. Besides the immediate price advantages to buyers, they should between them exert more pressure on the original manufacturers to raise their standards.

Acorn row looms

By John Lettice

A grim spectre haunts the micro industry — the spectre of humourless and trigger-happy micro manufacturers. The long hot summer now drawing to a close could end with a low-key cat-fight between Acorn and Future Computers.

The controversy in question is roughly as follows:

■ First, Future Computers advertises its new system as the only micro system with built-in networking.

■ Then Acorn contacts the Advertising Standards Authority, the magazines the advertisements appeared in, and Future Computers to dispute a number of points made in the ad, and hints to the magazines in question that they might like to avoid printing it again.

Acorn, it should be noted, has taken on a micro magazine in the past (issue 42).

■ Future Computers turns pale (we don't know this for certain, but it adds a certain amount of colour to the story) and makes a few amendments to the ad.

■ The Advertising Standards Authority tells Future it's OK to carry the running of the ad pending the results of its investigation.

■ Acorn doesn't like the new-look ad either.

■ Future holds a press conference, inviting Acorn, explaining that the BBC doesn't have built-in networking, and saying that it's a bit out of order demanding cave-ins of magazines when there's an ASA case pending. Acorn doesn't turn up.

■ Acorn issues a press release

disputing Future's claims, and complains about the press conference.

When asked about the affair an Acorn spokesman whimpers gently and puts the company's case for the ninth time. Acorn's pitch is that cheap networking is possible on the BBC B, so it's wrong for Future to say methods of networking prior to its own cost 'several tens of thousands of pounds,' and that 'now you can afford to benefit from a Future network at a fraction of anything else on the market.'

Future's pitch meanwhile is that the BBC B isn't comparable with the sort of heavy-duty office system it's peddling, and anyway the BBC micro doesn't have networking built in. But what seems to hurt most is Acorn's apparent campaign against the papers it's advertising in.

'Acorn consider it essential that these publishers are kept fully informed because of their associated liability,' says Acorn blandly, and the company makes it quite clear that it reserves the right to take legal action should it feel it is necessary. The spokesman further explains that a paper knowingly publishing a justify ad could find itself in just as hot water as the advertiser.

PCN's Glass Houses Department feels, like John Motson on Grandstand (August 25), that it's too early to reserve judgement.

Soft Projects adapts ace US games

American games for the Commodore 64 and other systems are to be increasingly available in the UK.

The Liverpool-based company, Software Projects, has signed licensing deals with Sierra On-Line, CVS Technology and Broderbund. The company is now selling BBC's Quest for Tires and, not content with just importing American titles, is working on translations for other micros including the Spectrum.

This marks an important development in the transatlantic flow of software — to date companies such as US Gold have simply bought rights to market American games in the UK, but Software Projects is currently working on the conversion of titles such as CVS's arcade game Hunchback at the Olympics and Broderbund's Lode Runner.

A number of new games are under development and are due for release in November; these include: Crypt Capers, Fatty Henry, Ledgerman, Karl's Kavern and a BBC utility Penguin Graphics. There will also be translations of games such as 'Jet Set Willy' and 'Manic Miner' for machines like the Amstrad and the MSX range. Other micros including the Oric, Vic 20 and Dragon will also be supported in the company's games range in the near future.

REED WARBLER — Silver-Reed has wheeled out an addition to its ever-growing family of printers with the EXP400 daisy-wheel unit (bottom right). At a leisurely 12 cps it is a representative of the current Japanese trend that is bringing prices down as fast as it reduces print speeds. The EXP400 costs £250; it is compatible with the evergreen WordStar and includes bold printing, sub- and super-script, and underlining. Silver-Reed (0923 45976) helpfully points out that 12 cps is equivalent to typing at 120 words a minute.

SOFTWARE

The new releases

Games

Spectrum: 'The greatest achievement in the history of home computing...' is how Bug-Byte describes it. What can it be: colour on a ZX81, a Commodore machine compatible with one of its predecessors? Put the trumpets away, it's merely a program conversion — Twin Kingdom Valley is now available on the Spectrum, with locations described in the halting tones of the Currah speech unit. The game will be in the shops by the middle of this month, priced at £7.95. To play 'rock's first adventure game' Aural Quest you'll have to buy a Strangers album, but you don't need to play that. Aural Quest will come with every copy of Aural Sculpture. The Inferno, from Richard Shepherd Software (06286 63531), is a graphics adventure based on a long poem by some Italian geezer. It costs £6.50. PSS (0203 667556) has unleashed Frank N Stein for £5.95.

Commodore 64: Upper Gumtree is another Richard Shepherd

offering, not based on a painting by Rolf Harris; it's an adventure set in a sleepy English village. The launch date is late September, the price £9.95 (£12.95 on disk). Creative Sparks (0252 543333) is releasing Danger Mouse in Double Trouble. The plot is roughly that you help secret agent Danger Mouse save the world — a snip for the world at £6.95.

Home/Educational

Commodore 64: Hewson Consultants (0273 693640) is joining forces with Longman to produce an exercise planning program called Shaping Up. At last, a use for those slimline disk drives you've been hanging on to.

Business

Spectrum: As a sequel to its highly-praised action-packed Stock Control, Kemp (01-444 5499) has released Purchase Ledger (incorporating nominal analysis). The program has space for 180 creditor accounts and 250 nominal accounts. It can be used with either cassette or Micro-

A window on MacAccounting.

drive and costs £24.95.

Macintosh: Peachtree Software (0628 32711) hopes to release MacLedger to follow MacCash in October in its MacAccounting series. MacPeachtree will charge £375 for the pair.

IBM: From the jolly blue giant itself comes news of three software packages for the PC: Multiplan 1.1 is a version with hard disk support as standard and extended memory, for £159 plus VAT; Pertraster 1000 and 2500 are upgrades of the original Pertraster, and they cost £646 and £845 respectively; and the ExecuVision Graphics Libraries store images on diskette for £63 to £69, again excluding VAT.

Various: Over 150 micros, says Teconics (0638 669106), can run its turnkey systems covering accounting functions from a database with various frills. Sagesoft (091-284 7077) is more specific: its Payroll program will run on CP/M and MSDOS systems at a cost of £195.

Systems/Utilities

CP/M: Cobol-specialist Ryan-McFarland (0992 24981) has released version 2.0 of its RM/Cobol for machines running CP/M-86 and MP/M-86 — a prime feature is its cross-compiling facility, whereby the object code produced will run in any RM/Cobol runtime environment. Microfit Technology (01-352 7876) is offering Menugen, a menu generator that will also run on MSDOS systems. It costs £34.50.

MSDOS: And PCDOS and compatible systems can now host UCSD Pascal, supplied by TDI (0272 742796). The company also supplies DOSFilter, a utility to let you read and write files interchangeably under MSDOS and the p-System.

These charts are compiled from both independent and multiple sources across the nation. They reflect what's happening in high streets during the week up to **August 23**. The games chart is updated every week.
 Neither mail order nor deposit-only orders are included in these listings. The prices quoted are for the no-frills models and include VAT.
 Information for the top-selling micros is culled from retailers and dealers throughout the country and is updated every month.
 PCN Charts are compiled exclusively for us by RAM/C, who can be contacted on 01-892 6596.

COMPUTERS

of Wigmore Street

104 Wigmore Street, London W1H 9FA

Telephone: 01-486 0373

To celebrate our move to larger premises across the road, we take great pleasure in inviting you to our 'Grand Opening', and . . .

★★★ FESTIVAL OF COMPUTING ★★★

Programme:—

September

Monday 3rd Noon

— Grand Opening — by a tribe of Topo Robots (as seen on TV), supplied by Prism.

**Tuesday 4th &
Wednesday 5th**

Demonstration of BBC, including Z80 and 6502 second processors — Torch disc pack — Teletext adapter — Digitiser — Gemini Datagem Database and Integrated business software.

**Thursday 6th,
Friday 7th
& Saturday 8th**

Demonstration of Memotech MTX, FDX disc drives, Solidisc, the incredible MRX graphics display using hard discs — RS128 — 128K version of MTX.

**Monday 10th
& Tuesday 11th**

Commodore presentation — 64 Modem and Compunet — 1541 Express loader — Printers and Monitor — SX64 Portable and sneak previews of Plus 4 and Commodore 16!!!

**Thursday 13th,
Friday 14th
& Saturday 15th**

Prism will demonstrate the Sinclair QL and the Enterprise computers — also Spectrum and BBC Modems — Wren Portable computer.

Throughout the exhibitions there will be a continuous display of Microvitec colour monitors — for Sinclair QL . . . Spectrum . . . BBC . . .

Spend £10 or more and gain the chance to:

Win a Sinclair QL

Draw and presentation on Saturday 29th September

Special offers — available throughout the Festival:—

BBC 100K disc drives	£99.95 inc. VAT
BBC 400K D/S drives	£169.00
Spectrum 48K + £50 software	£127.95
Prism BBC and Spectrum Modems	Special Reductions
Memotech RS128 (RS232 + 128K)	£399.00
Smith Corona TPI D/Wheel — Serial	£199.95
80 Col Dot Matrix — 80 CPS	£199.95
Fuller FDS Keyboards	£44.95

AND MUCH, MUCH MORE!!!

FROM OLD KENT ROAD TO MAYFAIR

Innovation info is patently obvious

Chris Rowley's *View from America* (issue 74) reported on RCA Corporation's recent US patent number 4,460,958 for a micro system. It may interest your readers to know that the inventors had also made application for a patent in the UK and, because of early publication requirements under UK patent law, the contents of US patent 4,460,958 were known in this country long before the US patent was granted and published. UK patent application GB 2 092 785A, complete with six pages of schematic drawings and nine pages of explanatory text, was published on 18 August 1982 — about 23 months before the US patent was published and, coincidentally, exactly two years before the cover date of *PCN* issue number 74.

Copies of UK patent specifications may be seen, free of charge, by any member of the public at the Science Reference Library in London and at public libraries in Birmingham, Glasgow, Leeds, Liverpool, Manchester, Newcastle and Sheffield.

D E Walker,
Industrial Property Section,
The British Library, London WC2

Imagine this as a top-selling game

Ralph Bancroft should imagine a bit harder (*Monitor*, issue 76). The Mersey Micro affair will be first and foremost a computer game. It will be written in Basic so that it runs as slowly as a mail-order firm.

PCN £10 Star Letter

Its box will have a multi-coloured inlay but the graphics will be as exciting as watching paint dry.

It will have more bugs than the insect house at the zoo — and it will get rave reviews in certain publications (not *PCN*).

And lastly, it will, of course, be a Magazine.

Andrew Turch
London NW11.

Three cheers for a caring supplier

I cannot be the only one to have experienced the results of responding to the Midwich Computer Company's advertisement for a Uchida 305 printer in issue 65 last June.

The machine arrived promptly, well packaged and good looking. It

Would you like to see your name in print? Here is your chance on *PCN*'s letters page.

produced letter quality print at a quarter the speed of my Tandy LPS and then suddenly went crazy. It began producing gibberish, then screwed up its ribbon and locked the print head solid.

I duly returned it under guarantee via Securicor for £15 and regretted having discarded the packaging. Midwich promptly sent me another without demur and I set it to work on the backlog. This time I kept the packing and . . . yes, Uchida II went the way of its predecessor. The woman at Securicor was thinking I would be a regular client.

I wrote a rather miffed sort of letter to Midwich this time, suggesting that a spot of hari-kiuri would be in order back on the Uchida farm in Tokyo, and would they please credit me with £300 or so against a daisy that actually wheeled and kept on doing it. That got me an apologetic phone call from a Mr Keith Balding to explain that Uchida had released a batch with duff transistors. In true Bushido spirit, he promised to send me a good one and refund my financial support for Securicor, which he duly did.

Well done, Midwich. And three boots for Uchida. I can't really say three times lucky, although it does actually work. But it has some bad habits with the margins, so I am taking good care of the packaging. If this one has to go back, I suggest they drop it down a well and telex Tokyo for a Samurai persuader.

Gordon Millington,
Guildford, Surrey.

QL review rap: sack so-called experts

I have just finished reading your 'definitive QL review' in this week's issue. I really think you should sack your reviewers and give authors with more balanced opinions the job.

Most of the article was destructively critical and there was only

occasional grudging lukewarm praise for the machine.

In the hardware section, Stuart Cooke seems obsessed with the keyboard and the non-standard sockets, and makes a sweeping conclusion that 'the QL does not live up to expectations' — an unfair comment after a largely irrelevant preceding section.

The software section contains no new information to speak of; and I presume 'atrociously slow screen I/O' really means 'slow Microdrive access', an undoubted problem with the word processor but one one which, I believe, has been helped by changes to the operating system in later versions of the QL ROM.

The SuperBasic review section is a mess. The author should know that concatenating strings uses the ampersand (&), not the '+' — which is used only for numeric data. The paragraph headed Strings merely mentions three unimportant bugs. Of far greater importance is how SuperBasic handles string arrays, which I personally find confusing especially assigning to sliced strings. There is no mention of the interesting 'coercion' concept, which makes the VAL and STRS functions unnecessary.

I own a first issue QL and of course it contains many bugs; but the fascinating Basic, the powerful MCG808 with its clear instruction set, and the free software plus a versatile and expandable computer that has a great future — make it amazing value, and it should not have received such a one-sided and thoughtless review, particularly from a respected magazine such as *PCN*.

Hugh O'Neal,
London SE24.

QL review rap: your view is flawed

Your QL review was misleading in several respects — your machine

must be faulty.

I have owned my 'AH' version machine for ten weeks during which time both Microdrives have been 100 per cent reliable even after hours of the machine being turned on, which is more than I can say for floppy disks and cassette units I have used. You say that they are slow in operation, which is admittedly true in the case of *Quill*, but don't mention that new, faster versions of the software are due out in October. You also conveniently fail to mention that, because QDOS multi-tasks while DELETING or SAVING (with auto-verify) these operations are practically instantaneous and hence faster than any floppy disk will ever be. And what about the type-ahead buffer?

The picture quality on both my Ferguson TV and Microcrite 1451 Cub monitor is beyond reproach, so what sets were you using?

The Psion software is more user-friendly and flexible than any of the so-called industry standards which I have used — nearly all such programs carry a 'Warning' — this program may crash 'message somewhere in the documentation if not in so few words; why give Psion such a hard time when, for the price of dBase II, you can buy a QL and four excellent programs, one of which is superior in many ways to dBase II?

You revel in pointing out obscure bugs in SuperBasic, but fail to point out the fast and extensive graphics commands and the fact that you can have 255 colours on screen at once using staples.

I could go on — I could in fact rewrite your 'definitive' review in a completely different light without any exaggeration. It was not to the normal high standards of unbiased and informed opinion which I have come to expect.

John Lawlor,
Inverurie, Scotland.

We stand by our review. Even though a number of people may think the Sinclair QL is the best thing since sliced bread there are quite a lot more who are definitely disappointed with its performance. In the PCN office we do have a number of machines passing through our hands each week and even though the QL does have a few nice points about it, the micro certainly falls way short of the standards set by other machines. We would also take issue with the 'corrections' in these two letters; we stand by our review.

We have seen several QLs at PCN: none of them performed 100 per cent. — Ed.

Air your opinions, share your experiences or just point out our occasional blunders. If you have an impressive way with words you may gain £10 for the star letter.

THE PSION

THE WORLD'S FIRST PRACTICAL

THE PSION ORGANISER

WILL CHANGE THE WAY YOU WORK

Imagine how much more convenient and simple your life could be with a full-feature microcomputer - including screen, keyboard, mass storage and software - in your pocket.

That's what THE PSION ORGANISER gives you - a uniquely versatile and innovative computing resource incorporating hybrid microprocessor technology more advanced and powerful than that found in micro computers twenty times the price!

A UNIQUE NEW INVENTION

Thanks to a Psion-pioneered breakthrough in solid-state drive technology, the ORGANISER's data and program packs offer open-ended, failsafe storage and ultra-fast operation.

- Built-in data-base facility allows instant access to programs and information.
- Simple operating procedures for ease of use.
- Off-the-shelf software library provides a mass of powerful programs and information designed to solve problems at work and home.
- The purpose-designed POPL programming language enables you to write and save your own programs.
- Communicate with office computers, printers and other peripherals through a standard RS232 interface.

PACKED WITH EXCLUSIVE FEATURES

- Solid-state drives access information in milliseconds.
- Information stored on datapaks is totally secure. Datapaks may be removed from the Organiser and still retain their information. Datapaks are re-usable through formatting.
- Solid-state drives allow the open-ended use of software and data. There's no limit to the amount of information or variety of programs which can be slotted into the drives.
- Auto-switch off after 5 minutes and low power-consumption CMOS components give six months' life in typical use with standard PP3 battery.
- 16 character alpha-numeric display with full scrolling over a 200 character record with adjustable contrast.
- Includes an editable calculator. Lets you carry out complex calculations involving up to 200 characters and two levels of brackets. Using the editing facility you can amend your calculation during entry. Moreover, you can go back and edit both data and formulae after a calculation has been carried out allowing you to carry out "what if" analyses.
- The special UTILITY PACK extends the power of the calculator even further with an extensive

ONLY
£99.95
 (+P&P)
Includes FREE
 -8K Datapak
 -Utility Pack

range of additional mathematical and scientific functions.

- Includes time and date clock function.
- Tough, protective sliding case.
- British designed and built with the highest quality engineering including gold-plated contact points and connectors for rugged, reliable use.

THE PSION ORGANISER:
 THREE WAYS TO
 PRACTICAL POCKET-COMPUTING

Use THE PSION ORGANISER in any of three ways:

AS YOUR OWN PRIVATE DATABASE TO STORE PERSONAL INFORMATION AND RETRIEVE IT INSTANTLY

You can use the Organiser to store all the vital day-to-day information you need -

Names and addresses	Customer and supplier records
Meeting notes	Survey information
Schedules	Statistics
Important dates	Exchange rates
Expense details	Experimental data
Restaurants	Personal Reminders
Timetables	

ORGANISER

TICAL POCKET COMPUTER

THE PSION ORGANISER: IT'S LIKE HAVING A FILING SYSTEM IN YOUR POCKET

Forget about diaries, notebooks and the backs of old envelopes. THE PSION ORGANISER allows you to type in information as you want and file it away at the touch of a key for instant future reference.

Retrieving information is every bit as simple. Just type in a keyword, a few characters, or even a date and number. THE PSION ORGANISER will search out the appropriate records and display them on the LCD screen. The simple scrolling facility allows you to view an entire entry up to 200 characters long.

Entries can be easily amended and edited and, since all data is permanently stored, there is no danger of it being lost – even if the battery is disconnected. A choice of 8k or 16k datapaks is available for you to build up an infinitely large information base.

WITH READY-TO-RUN SOFTWARE FOR IMMEDIATE PROBLEM SOLVING

A comprehensive range of ready-written software programs is already available for THE PSION ORGANISER and more are on their way.

FINANCE

LINK-UP COMMUNICATIONS

- Industry standard RS232 with ribbon cable plugs into a solid-state drive.
- Configuration module sets the Organiser to transmit and receive programs and data. Options are selected using the cursor keys including:
BAUD RATE : 150-9600
PARITY : ODD, EVEN, MARK, SPACE, NONE
PROTOCOL : NONE, RTS/CTS, XON/XOFF

AS A PERSONAL COMPUTER TO RUN YOUR OWN PROGRAMS

THE PSION ORGANISER has its own programing language – POPL – contained in the Finance, Maths and Science packs.

POPL is built around a set of straightforward commands such as IN, OUT and GOTO. It enables you to write your own programs which can be as simple or as sophisticated as you choose. By storing and saving programs in a datapak, you can run them whenever you need.

DEVELOPED BY ONE OF EUROPE'S LEADING MICROCOMPUTER SOFTWARE COMPANIES, THE PSION ORGANISER IS THE WORLD'S FIRST PRACTICAL POCKET COMPUTER. FILL IN AND RETURN THE "FREEPOST" COUPON TODAY AND GET THE POWER OF A DESK-TOP MICRO IN YOUR POCKET – OR CALL US ANYTIME ON 01-200 0200 TO PLACE YOUR ORDER

Four books to guide users through the micro maze.

'The Adventurer's Notebook' by Mike Gerrard, published by Duckworth at £3.95 (paperback, 123 pages).

Mike Gerrard, known to most of our readers as the author of the PCN Adventures column, has produced the ideal tool for adventure addicts.

Throw away all those messy bits of paper. Here you have a scrapbook with pre-drawn map templates to keep all that vital information at our fingertips.

The 'fill it in as you go along' section makes up more than half the book: 78 pages to be precise. It consists of blank tables with columns marked Location, Objects Found, Action Tried and Result, as well as the pages and pages of squares that make up the map templates.

The rest of the book is made up of an introduction to adventuring, some hints and general advice, a history of adventures and three appendices.

The hints section is aimed at both the beginner and the seasoned player. Sprinkled with a liberal helping of examples from a variety of games, the various pitfalls and tricks that can overcome them are described.

Adventures tell a story, in much the same way that storytellers of yore did — or so Mr Gerrard would have us believe. He also sees the role-playing games such as Dungeons and Dragons as a major influence on computer adventures.

The appendices contain Mr Gerrard's recommendations as to which adventures are worth playing, a list of useful addresses (of software houses) and a glossary of synonyms for when you get stuck for words. My main criticism of the book is the limited range of adventures mentioned in the recommended section. A table of

adventures with some kind of rating would have been more useful, and why on earth aren't Apple games mentioned at all? Some of the first adventure implementations were on an Apple.

Apart from this minor gripe, it is an excellent book which will make any ardent adventurer's life a lot easier. **LB**

'The Personal Computer Handbook', by Tim Hartnell, published by Virgin at £4.95 (paperback, 155 pages).

Here at last is an eminently readable, yet in-depth guide to the fast-growing personal computer marketplace for novices and technocrats alike.

This is by no means computer journalist Tim Hartnell's first offering in what is now becoming a crowded sector of the publishing industry.

For the personal computer shopper this is probably one of the better books around today. Talking potential customers through the maze of brands, cost, functions and, more importantly, specifications in an easy-to-read and lucid style, Mr Hartnell gives some handy tips on what exactly to look for — be it for personal or hobbyist purposes.

The Personal Computer Handbook though is more than simply a buyer's guide. It features a history of the personal computer with a neat summary of the rise of Clive Sinclair, among other things, as well as sections on programs and user groups. **COG**

'Getting the most from your Lynx' by Steven Jedowski, published by Penguin at £5.95 (paperback 128 pages).

Getting the most from your Lynx, apart from being a shaggy cat story, is not bad. After it

starts out rather simply, it gets down to introducing the Basic and gives you a few ideas for programs to write, such as a compound interest evaluation routine.

Following this introductory session, there is a section on how the computer works. This uses those examples that use a light bulb to show how binary

works (click on, click off). I suppose that this is the definitive method but it would be nice if somebody could come up with something a little more original. The author then gives you more about Basic — and yet more about Basic. Then comes the pretty bit with the pictures: Graphics and Sound. In the centre of this section are four pages of screen shots. These are very cute, showing the good old Jack of the Union, a bit of Moire fringing, and some pictures that are just downright clever.

Unfortunately, there are no details on how these were produced. There are then a few pages on sound.

After a few comments about add-ons, the author gets back to Basic to cover a few of the more obscure aspects, such as REPEAT UNTIL, Procedures, and WHILE WEND.

Then, the book gets down to getting the most from the machine, with a few hints and tips about the alternative green, moving the display up and down, and olding accidentally newed programs. An interesting section is that on loading cassette programs. Apparently, Lynx problems tend to be caused by phase inversion, the solution being to reverse the connections of the cassette lead (signal for ground). This is the one thing that I have never tried but if it works, whoopee.

Finally, there is a brief com-

ment on the larger versions of the machine and what they are capable of, CP/M etc.

Overall, for £5.95, the book does not really provide more than the manual that comes with the machine. It is also rather quiet about getting the most from your system. The Lynx is actually quite a flexible piece of kit with some nice aspects, if only somebody could write something that mentioned these. **KG**

'Training your Dragon' by Richard Collins and John Sharp, published by Prentice Hall at £7.95 (paperback, 297 pages).

Here is a book devoted to elementary Dragon programming and as such it succeeds — more or less. The text is wordy, but at least this avoids ambiguity. There are 25 chapters, the index is comprehensive, but the chapter on peek and poke could have been far more comprehensive: no useful ROM calls are listed and the chapter (which includes the sum total of information on machine code) only runs to 14 pages.

The book's detail is tremendous, but overwhelming. It takes the authors so long to spell out what they're trying to say, that all too often you lose track of what the topic is. There are too many throwaway lines like the one towards the end of the chapter on arrays: 'You should be able to see that this makes any searching or accessing easy since it can all be done by indexing'. True, but indexing is not explained, and only seven are allotted to arrays which, we are told: 'are such useful programming tools'.

This is an overpriced, over-detailed introduction to extended Microsoft Basic and you'd do better to spend £7.95 on more concise texts. **BS**

DON'T MISS THE MAGNIFICENT SEVENTH

**TAKE AN IN-DEPTH VIEW
AT THE PCW SHOW**

If you're really interested in the world of micro-computers there's only one place to be in September. The most popular micro-computer show in the world. The 7th Personal Computer World Show at Olympia 2 from September 20th to the 23rd.

Mingle with the giants of the micro world. Find out what's new and up and coming your way. We think you'll profit from the experience.

So if you want to be in the know, you know where to be in September.

The 1984
**Personal
Computer**
World
Show

20-23 SEPTEMBER, OLYMPIA 2 LONDON

September 19th - Trade/Press day only.

**The greatest micro
show on earth.**

TIMES: 10am-7pm weekdays, 10am-5pm Sunday. **FEATURES INCLUDE:** "BBC Radio Live at the PCW Show," Businessman's advisory centre, Top 20 Games sponsored by Websters, The Leading Edge/the latest products at the show, Amateur Computer Clubs, "Mastering the Micro" - Top 20 Computer Books/Software. **ADMISSION:** £3.50 p.p. Group tickets (10 people and over) £2.50 p.p. Children (under 12) £1.50.

Please apply for your advance tickets to: Montbuild, 11 Manchester Square, London W1. Telephone: 01-486 1951.

If you're having trouble programming arrays in your Spectrum adventures, let Kenn Garroch show you the way.

Arrayed for action

Initially arrays can be confusing, but once you grasp the idea it's clear that they're both useful and logical. The easiest way to visualise an array is to think of it as a table, so by saying DIM a (10,12) you're DIMENSIONING an array of ten characters by 12. All you're doing, in fact, is drawing up a 10x12 table of empty type boxes, and reserving the right to fill it with numbers later.

Arrays, both numeric and string, tend to be an important element of adventure programming, and this provides a good illustration of how they operate. But the standard adventure displays only half of the array's potential. Normally, adventures come with the arrays already filled with details. You can, however, design an adventure that allows you to fill in the location descriptions before you actually play it.

Arrays allow you to negotiate a sort of maze, picking up pieces of gold and confronting various monsters. Let's see how to write a program that allows you to define the rooms and passageways and wander around them.

Trade-off

The best way to start the program design is to work out what arrays will be needed.

Since the program needs a set of descriptions for the rooms etc, you need a string array to hold these. The total number of locations possible is set by the amount of memory you have available. In the program that follows, this is set to 10 using the variable M, and can be increased until the memory runs out. The length of the description string is set with T, which can also be increased, but eats up large quantities of memory. The trade-off is between many locations with short descriptions, or a few with more details.

To use the description array, you need a set of pointers to allow the rooms to be linked together in various ways. You must also set the pointer array to default values. Section 1 of the program does just this.

The next thing to do is to set out some kind of control for the program. This is the main menu and gives the options to edit the descriptions, load and save definitions, link up the rooms in a random way and play the game. This is dealt with by Section 2 of the program.

The end option is relatively easy. To make sure you don't come out of the program without saving the data, it is generally a good idea to ask before doing something as drastic as stopping. This is dealt with by Section 3.

The next sections are the major parts of the program. Let's take the editor first. This is again controlled from a menu which provides all the major options for defining

a series of locations. Section 4, the menu, is written in exactly the same way as the main menu.

Taking these options in order, Section 5 is a routine to list the locations that have, or haven't, been defined. Obviously, if there are several locations it's a good idea to allow some kind of escape mechanism to get back to the previous menu.

One of the clever things about the Spectrum's Basic is its ability to perform the print statement in line 366, allowing the exits to be printed only if they have been specified by putting a zero in the 'E' array.

This direction specification is performed in the edit location section that follows (Section 6). This just asks for the location number and then expects a set of exit directions — which are 'north', 'south', 'east', and 'west'.

Directions such as 'up' and 'down' etc can be added by changing the DIM in line 25 and 30 to allow space in the E and S arrays.

After entering information, you don't need to use it all. Section 7 checks the entries and puts them in the correct positions on the 'E' array, North being E (T,1), South being E (T,2) and East and West being 3 and 4 respectively. Using this routine allows the exits to be entered in the wrong order without confusing the program.

Once all the locations have been defined and described they need to be attached to each other. Normally an adventure will have these predefined as part of the game. Since this is a simple adventure and contains no movable objects, we have to make it exciting somehow. This is done by

allowing locations to be attached randomly to each other, but making sure that if you exit south then you must enter north, as in Section 8.

The juggler routine is split into three main parts. The first is a subroutine that resets the original directions into the E array (subroutine 1060). The juggler then goes through the locations and checks whether they have any valid exits. If they contain 0, an exit, the routine jumps down to line 520 and roots through 100 random locations until one is found that fits the bill of matching North to South, East to West, etc. The location numbers are then swapped over in the E array, making a connection (see Section 9).

Ready to go

The next major section of the program, Section 10, allows the adventure to be run. First the description of location 1 is displayed and then the exits are given. After entering the direction to be followed, lines 640 and 650 work out whether the direction is valid or whether it has not been assigned. Line 680 assigns the new location number to L, the current position.

The other options are L, which reprints the current description, and F, which allows you to get back to the main menu. Again, to make the program as idiot-proof as possible, it is a good idea to ask if the player wants to end with Section 11.

The final subroutines, Section 12, are generally concerned with data handling, and allow the main game array to be saved and loaded from tape or from Microdrive.

Since the juggler program alters the E

array, to rejuggle the program, the directions need to be saved somewhere. Section 13 loads and saves the EArray in the SArray (5 for save).

And that's it. You can probably think of hundreds of improvements to this, and it

has been written in such a way as to allow these to be entered with ease.

The art of using the program to define a good adventure is to make the locations interesting enough that they stand up on their own. If you want to provide monsters

simply enter a description such as: 'You stand in a dank, dark closet. From the corner comes a piercing shriek which dies away through a whimpering moan. Cobwebs brush your face.' And the rest is up to you...

The Graduate.

The first IBM PC
compatible upgrade
for the BBC model B micro.

From only £764.00 the new Torch Graduate will upgrade your BBC Model B to a powerful 16 bit business computer

TECHNICAL SPECIFICATION

- 8088 16-bit processor running at 5 Mhz
- 128K or 256K RAM
- MS™-DOS operating system customised to IBM compatibility
- Model G400 - Single, double sided, high density disc drive (320K formatted)
- Model G800 - Twin, double sided, high density disc drives (640K formatted)
- Integral stabilised power supply
- 2 IBM PC compatible hardware expansion buses
- Software compatibility allows Lotus 1-2-3 and all popular IBM PC business programs to run without modification, subject to the constraints of the BBC keyboard and display
- Disc interface is not required
Keyboard text and graphics supplied by BBC Model B

• THE GRADUATE •

Disc and hardware compatible with the IBM PC, the Graduate is the latest addition to the Torch range of BBC upgrades. It's MS™-DOS operating system is customised to IBM compatibility allowing exploration of the massive range of IBM compatible business software, programming aids, compilers and languages universally available from most major software houses.

Introduction to MS™-DOS

The Graduate offers two levels of upgrade, the G400 and the G800, both with 128K on board user memory as standard (optionally 256K). This can be increased to 1.2 Mbytes with an IBM compatible expansion board. The G400, contains a single, double sided 320K formatted disc drive and provides the low cost introduction to MS™-DOS for the

user who wants real 16 bit power from his Model B.

More data storage

A step up from the G400 is the G800 which offers twin, double sided 320K disc drives for extra data storage. Both the G400 and the G800 provide the possibility of further expansion for networking, modems, etc., via the IBM compatible hardware slots provided

by the Graduate models. Each model comes complete with a well written user/technical manual and connecting leads.

Just plug it in

Unlike other add-ons there is no need to open the BBC to make the connection. The compact and tidy Graduate models simply plug in to the 1MHz bus on the Model B. Within minutes you can be up and running with an IBM PC compatible system that really means business.

The range

Add 256K RAM, 640K disc storage and IBM PC compatibility to the BBC Micro for less than £1,000.

Graduate G400 (128K) £764 inc. VAT
Graduate G400 (256K) £815 inc. VAT
Graduate G800 (128K) £949 inc. VAT
Graduate G800 (256K) £999 inc. VAT

Scroll the Amstrad screen display with Clare Gurton's simple machine code routines.

Amstrad scrollwork

It's often useful to scroll a computer's screen display up or down, particularly in games. On most machines you can scroll the screen up a line by printing in the last screen cell, but there's no way you can reverse the process to scroll the screen downwards.

Of course, it's possible to write machine code routines to shift the screen display about according to your needs, but this means getting to grips with assembly language programming, and most of us would rather steer clear of that.

Fortunately, the Amstrad ROM is so well-documented that it's possible to write very simple machine code routines which call up ROM routines to do such complex tasks.

For example, there's a ROM routine called SCR HW ROLL at &BD4C (50395 decimal) which uses the Amstrad's hardware to scroll the screen up or down, depending on the contents of the B register. The ROM routine moves the screen by eight pixel lines (one character row) at a time, and fills the new top or bottom row with the colour given by the ink code of the contents of the A register. If the contents of the B register is zero, the screen scrolls downwards, and any non-zero value forces an upwards scroll.

There are two simple ways of using the ROM routine. Either you can set up a single routine which you have to change by one byte (via a POKE) before calling it, or you can set up two routines, one for up, the other for down, and that's the first method shown here.

Each routine will first load the B register with the relevant value—255 for up, 0 for down—then call the ROM routine and finally return to Basic. Loading the B register uses the mnemonic LDB, n (where n is a number between 0 and 255). The op-code for LDB is 06, so this will be the first byte of each of the assembled routines. For the down-scroll routine the next number will be zero, while the up-scroll routine will need any non-zero value—FF (255 decimal) will do.

Calling the ROM routine requires the mnemonic CALL nn, op-code C9, 205 decimal. The ROM routine begins at &BC4D (50395 decimal) and, because the Z80 works on the low byte, high byte principle for referring to 16-bit addresses, we'll need to follow the CALL with 4D (77 decimal) then BC (188 decimal). Finally, the routines must return to Basic via the mnemonic RET, op-code CD, 201 decimal.

The Basic loader for the two routines is given in Figure 1. You can RUN this, then delete it before entering a program which uses scrolling. You'll have to set memory to 43879 to preserve the routines from

corruption by Basic programs and their data.

The routines are assembled from 43880 and to use them you just call the relevant addresses. CALL 43880 will scroll the screen up, while CALL 43886 will perform a downwards scroll. You may find it easier to set up two variables such as: down, scroll = 43880; then use CALL up, scroll and CALL down, scroll. Figure 3 demonstrates how to use the routines like this.

Figure 4 gives the details of a rather more complex, single machine code routine which will repeatedly call SCR HW ROLL according to the contents of address 43871. As given, the routine uses an ink value of zero and scrolls the screen up by ten lines.

You can alter any of these by POKES to the relevant addresses. You can POKE 43877 with 0 for a down scroll, 255 for up, while the ink colour for the newly created top or bottom line is held in 43873. So, if you wanted the screen to scroll up ten times you'd POKE 43877, 255; POKE 43871, 10; CALL 43870. The last listing (Figure 5) is the Basic loader for the routine.

This routine uses the B register as a sort of loop counter. The routine begins by loading the B register with the contents of address 43871, which is why you have to poke this address with an eight bit number (<=255) for the number of lines to scroll.

Next, the colour for the blank line which will be created by a scroll in either direction is loaded into the A register. Both A and B have to be PUSHED onto the stack before calling the ROM routine because it corrupts all the register pairs. The last action before calling SCR HW ROLL is to load the B register with the direction in which to scroll the screen.

When the ROM routine returns, the AF and BC register pairs have to be restored (POED) for the next operation. This is the Z80 instruction DJNZ — decrement and jump on non-zero. This subtracts one from the B register and jumps according to the displacement (two's complement) in the next byte if the new content of the B register is not zero. When the DJNZ operation results in zero, the zero flag is set, the test fails and the routine ends in RET, passing control back to Basic.

Ideally, you'd use an assembler to work out the displacement for you, but until one is available for the Amstrad you'll just have to hand-assemble awkward details like this.

In this example the program flow needs to be directed back to address 43874, which is nine bytes back from the address of the DJNZ instruction. However, you have to add 2 to this value, because the program counter (PC) will be pointing to two bytes on from the DJNZ instruction by the time the decrement etc has been done. This means you want a negative jump of 11 bytes.

To translate a negative decimal number like -11 into its two's complement, write down the binary pattern (00001011), rewrite it with all noughts replaced with ones and vice versa (11110100). Then add one to the binary pattern (11110101) and finally convert to decimal (245) which is the value you put at address 43884 as the negative displacement for the DJNZ instruction.

Figure 5 also gives demonstrations of the routines. You'll find that altering the value contained in the A register results in some interesting coloured textures.

PCN PRO-TEST HARDWARE

Another micro for the computing novice has emerged from Commodore. Barry Miles welcomes it with open arms.

SWEET SIXTEEN

The circuit board inside the C16 has been greatly reduced compared to those of the Vic 20 and the Commodore 64 which used to fill the whole case.

The Commodore 16 is a replacement for the ageing but immensely successful Vic 20. It has the same price tag, but more features to offer the microcomputing novice. The buyer's £139.95 gets the machine, four pieces of software, a cassette unit and *Introduction to Basic part 1*.

The Commodore 16 has 16K of RAM and 32K of ROM which covers the operating system and Basic interpreter. Graphics are well catered for. There are high-resolution graphics, multi-colour graphics, a split screen offering text and high-resolution or multi-colour graphics. As on the 64, the display is 40-column and the graphics resolution is 320x200.

The two sound generators included on the machine are for musical tones and for white noise.

Curiously, while the Basic is superior to the 64's, Commodore has ignored sprites. It was sprites that offered the beginner programmer the opportunity to design and implement some form of game, for all that the sprites worked slowly in Basic.

Commodore delights in creating new market slots at different levels for its various products, and ignores compatibility between various models. This approach has been maintained on the 16. But, in a sense, since this is intended for beginners there is no need to maintain compatibility of keyboard design or interfacing sockets.

First impressions

The machine's dark brown case resembles a 64 or a Vic 20 until you notice the cursor keys have doubled in number to four cursor keys and an Escape key. A Help key has replaced one of the function keys. The rear of the machine holds the memory expansion port — it looks similar to the Commodore 64's, but 64 cartridges and add-ons will probably not work.

The TV and monitor connections are the same as on earlier machines, as is the serial output port for connection to Commodore's own serial products. However, the cassette connection is different so using the supplied cassette recorder is obligatory.

The joystick connection has also been changed — only Commodore's own new 'improved advanced joysticks' will fit the bill.

The list of peripherals which work with the C16 is quite long. In addition to the

1541 disk drive, the 1526 dot matrix printer and the 1520 plotter, are such attractive newcomers as:

- SFS481 fast disk drive. (An interesting model, which unfortunately doesn't run with the Commodore 64, but does make the 16 and Plus/4 altogether more attractive),
- MCS 601 colour dot matrix printer,
- MPS 802 dot matrix printer,
- DPS 1101 daisy wheel printer,
- C1703 colour monitor.

These are designed to match the new computers, both electronically and in appearance.

The Reset button is a new departure. The way it is implemented is highly attractive as will become clear later.

Documentation

Only preliminary documentation was available for the review. This was adequate — perhaps Commodore, learning from past experience, is going to produce some improved documentation.

Although the manual was preproduction it was well written, with an overall view of the machine and a detailed section which lists all the keywords with full explanations. Memory maps are provided and full details of how the machine code monitor works — yes, there is a monitor in this machine which will please would-be machine code programmers.

Construction

The 16 seems reasonably well built. The keyboard is pleasant to use and raked at an

angle which most typists will like to use.

It is quite apparent that Commodore has paid great attention to past criticisms levelled at them. Every effort seems to have been made to make the machine easy to program. First, the Help key locates the error which caused your Basic program to stop. Second, the Function keys are no longer blank on power-up, requiring you to find out how to program them — details which were hidden away in the reference manual for the 64. The machine comes with sensible defaults preprogrammed on to the keys, and the Basic has a command which enables you to reprogram them easily. See Table 1 for function key defaults.

The keys can be redefined from within a program as well as in Direct Mode. This is convenient because you can have a set of key definitions in files on disk and run a program to redefine keys as you go about various tasks.

PCN PRO-TEST HARDWARE

The rear of the machine holds most of the expansion sockets. The monitor, Disk/Printer and expansion sockets are the same as those on the 64. The cassette socket has been altered to suit the cassette recorder provided.

The inclusion of a reset switch on the C16 is a new venture for Commodore. You can now reset your machine without having to buy add on switches. Note the new style joystick connectors.

Table 1:
Function key default details

- | | |
|--|---|
| F1: enters one of the Graphics modes of operation. | F5: prints DSAVE, followed by inverted commas, leaving you merely to add the filename. |
| F2: prints DLOAD, followed by inverted commas, so you can type in just the filename and hit Return to load from disk. | F6: runs the program, which is in memory. |
| F3: lists the directory without disturbing the program in memory. | F7: lists the current program. |
| F4: clears the screen, even if you are currently in one of the Graphics modes. | F8: this is the Help key. It causes the line in which an error has occurred in a Basic program to be listed, and the errors to be highlighted in print which flashes on and off. |

The Escape key implements a considerable range of additional functions, which increase further its programming attraction. (See Table 2.)

The Control key also has a number of functions to perform. Control plus a colour key selects colours indicated on the upper set of markings on the colour (numeric) keys.

Listing or printing to the screen can be paused by pressing Control plus 'S'. Any other key restarts printing. Control is also used to put reverse field and flashing into and out of operation. The Flashing command causes subsequent letters to flash on and off until you type Control and Flash/Off, Return, or Escape.

The Commodore Logo key picks the graphics mode you want. It also selects from the additional range of colours available according to the lower set of markings on the colour keys.

Cursor-movement is controlled by four keys. Old timers, used to the 64 or Vic 20 could be caught out by the cursor keys' move to the top row. Commodore never fails to rearrange a number of keys on a new machine — a well-established tradition.

The machine's full typewriter-style keyboard is attractive. For those who use disk drives with this machine, the well-known Basic 4 disk commands, missed on the 64, have been incorporated here in the Basic 3.5. Wear and tear on the hardware caused by switching the machine on and off has been eliminated. The Reset button, well-recessed to avoid accidental pressing, not only resets the machine completely but, if pressed while holding down the Run/stop key, enables you to jump to the machine code monitor. This acts like a Butterfield switch, as it is known in the Commodore fraternity.

Commodore 64 users have been frustrated by the machine's liability to crash, leaving them powerless to escape and investigate it. The machine becomes confused, leaves the normal mode of operation, and any amount of key pressing is to no avail. All you can do is to reset the machine and start from your last saved version of the program. This is particularly a problem where machine code programs are concerned. Any mistake made in a Basic program is normally trapped by Basic, but machine code errors normally leave you with a condition which you cannot remedy.

However, on the C16, you can operate easily and confidently. If your program crashes you reset the machine, jump out of the monitor by hitting X, and find to your pleasure that the Basic program is usually still there. Additional information is given in the user manual on how to un-new a program when you have accidentally eliminated it.

Software

At the time of writing, software for this machine is conspicuously absent. However, the C16 is produced by one of the top selling micro companies both in the UK and in the world. The amount of software becoming available for a machine depends on the software producers' view of its

PCN PRO-TEST HARDWARE

potential success. The Vic and the 64 have sold worldwide, so software houses should be falling over themselves to produce games and application software for the C16.

The Plus 4, announced at the same time as the 16, is very similar, which means the minimum of effort is necessary for software houses to convert programs to run on those machines. Virtually any software package you could want is likely to be available for this machine within about a year.

Basic

Apart from the absence of sprites and a reduction in the sound facilities, this Basic represents by far the best that Commodore has produced so far.

First, it is a proper disk Basic with commands like DIRECTORY, COPY, BACK-UP, VALIDATE and DE-LOAD. The ability to load a directory without disturbing the

Table 2:

Additional functions implemented by Escape
Escape followed by one alphabetic key yields:
A Automatic Insert Mode.
B Set bottom right corner of window.
C Cancel Insert Mode.
D Delete current line.
I Insert a line.
J Move to start of current line.
K Move to end of current line.
L Turn on scrolling.
M Turn off scrolling.
N Return to normal screen display size.
O Cancel Insert, Quote, Reverse, and Flash Modes.
P Erase up to beginning of current line.
Q Erase up to end of current line.
R Reduce screen display.
T Set top left corner of screen display.
V Scroll screen up.
W Scroll screen down.
X Cancel Escape function.

PCN PRO-TEST HARDWARE

Even though the C16 looks similar to the Vic 20 and the CBM 64, a number of the keys have been altered. The two keys used for controlling the cursor have been replaced by four keys and moved to the top row. Function key F8 has been replaced by a Help key that will highlight any errors.

program which is in memory is particularly important, especially to new users.

The so-called Toolkit commands are at last well-represented in the Basic within a Commodore machine. Automatic line numbering, deletion of sections of programs, turning Trace on and off, renumbering Basic lines; all are now available in a standard machine. Getting into the machine code monitor is now accomplished elegantly by typing the word MONITOR, rather than having to use a SYS command. PRINT USING is now available and it is an advanced form, enabling you to do most of the formatting definitions you want quite easily.

Error trapping is available with a special TRAP command enabling you to trap what the error is and give a suitable error message to the user.

The GETKEY command enables the machine to take a series of single characters from the keyboard without having to write line numbers which use GOTO and jump directly there.

Until now Commodore machines have been justifiably criticised for the difficulty in achieving structured programming. However, in this implementation IF... THEN... ELSE, DO... WHILE and DO... UNTIL, are present. Structured programming enthusiasts should note Comal on the Commodore 64 is due to become available soon, and it seems extremely likely this will be made available for the 16 too. If Comal is put into cartridge for this machine, sprites may even be created for it. After all, the Comal team created sprites on the Pet, using their own high-resolution graphics board.

Colour commands and high-resolution graphic commands have been taken out of the realm of frantic poking and put into the

Basic where they belong. They include painting, drawing circles, drawing rectangles, drawing lines and so on. You even have a SCALE statement. Graphs where all the tedious tasks of scaling the information is taken on by the C16 are possible.

Sound is also well represented though there is one less voice than on the 64.

There is evidence that the speed of the C16's Basic doesn't match the 64's, but this should prove acceptable in view of the increase in capability.

Even the machine code monitor (absent from the 64) is better than the monitor associated with previous Commodore machines. The memory-dump includes an ASCII dump and the disassembler, and the memory dump produces screenfuls of information, one at a time. Although it's a pity bi-directional scrolling isn't available, both in Basic and in the monitor, the monitor still represents a major step forward.

Verdict

The new machine provides an excellent introduction to computing with a good Basic, user-friendly editing, high-resolution graphics and sound. There is the full expectation of massive support by independent software producers.

Packaged as it will be, the C16 represents a good deal. The intrinsic value of a 16K RAM computer is not an issue. The Vic 20 has remained popular despite the success of the 64. The reason is skillful bundling of software and cassette with the machine, together with the vast array of increasingly available software. Where cartridge software is involved, the limitation of memory is partly overcome anyway.

It could even be Commodore's way into Britain's classrooms.

The Commodore 16 is definitely the machine to watch out for in the run up to Christmas: it may beat the pants off the other sub-£200 machines.

PCN

SPECIFICATIONS

Price	£139.95, including cassette drive, <i>Introduction to Basic Part 1</i> , and cassette, and four recreational programs. 7501 running at 0.89 to 1.76 MHz.
Processor	32K
ROM	16K-12K accessible to Basic.
RAM	40×25.
Text	320×200.
Graphics	integral full travel with four function keys.
Keyboard	user port, ROM cartridge and parallel disk drive port, two joysticks
Interfaces	ports, Commodore 1531 cassette interface port, monitor output, composite, chrominance, luminance, audio input/output.
Storage	Commodore 1524 disk drive, Commodore SFS 481 fast disk drive, Commodore 1531 datasette.
Language	Basic
Distributors	Retailers

Pen Pal

This nifty plotter won Kenn Garroch's approval.

A plotter, like a robot, is one of those peripherals most computer users would like to have but feel they cannot justify the expense. The Parfitt plotter may be the answer as it is fairly cheap. Far from being just a flat bed plotter, it can be used for scanning pictures, milling shapes out of polystyrene, engraving glass and, due to its flexible design, anything else you can think of.

Presentation

The standard plotter comes with three pens, some paper, a manual and software on cassette. It measures about 58cm by 41cm and has a tasteful smoked plastic dust cover. The paper size is normally A4 though at a pinch it can be used with A3. However, not all the pens can be used, due to their not accessing exactly the same area.

Each pen is slotted into a tube-like holder and lifted up and down by means of a solenoid. The pen holders are flexible enough to allow almost any type of pen, from the rather expensive fine pointed plotter pens to low price Parker felt tip refills.

At the moment the plotter is available only for the RML 2s, the BBC B and (in future) for the Commodore 64. It is not hard to recognise that the system is aimed at the educational market.

The demonstration software came on disk and was fully menu-driven. Although these programs could have been better, they do their job well. Some of the demo options are: point to point plotting and pen selection; drawing of multiple polygons, an opto sensor scan routine, and some examples of what can be done with the opto system with a picture copied from a map of Britain and a gearbox cross-section.

Also supplied with the review model was *classdem*. This allows three-dimensional wire, beer, or spirit glasses to be designed on the computer's display and plotted out onto paper.

Getting started

The plotter was set up with a BBC B and connected via an interface to the user port. There is the option of using the BBC's own built-in power supply or, for those who happen to be running disk drives, there are two separate supplies available at an extra cost of £89.70 and £48.30. The more expensive version provides extra power for the milling attachment and has a rotary potentiometer for speed adjustment.

The most difficult part of setting the plotter up was adjusting the pen height. However, this is explained in great detail in the instructions.

Once the pens are in position, simply dropping them into their assigned tubes means the plotter is ready to start drawing. The Demo disk was autobooted and one of the options selected.

This is where the problems started. There was no precise explanation of where the origin was or how to get there. This meant that in some of the early drawings the carriage juddered against its stops and the software got lost, thinking that it had reached its desired position when it had jammed. The only solution seemed to be to press the BBC's escape key, thus rebooting the disk.

The review system seemed to get lost in other places as well. However, when I removed the Torch OS from the sideways RAM and rebooted the whole system it worked more or less faultlessly.

In use

After getting a little tired of the demo drawings, the next thing to do was to have a look at the direct control routines. These are all available to Basic via a set of CALLS: **MOVE, X, Y** Move to absolute position, pens up.

DRAW, X, Y, pen Draw to absolute coordinates with the specified pen.

LINE, X1, Y1, X2, Y2, pen Draw line from X1, Y1 to X2, Y2 with specified pen, lifting it at the end.

SPEED, S Set the plotting speed.

STRING, AS, size, pen Write AS at current location and orientation.

ORIENTATION, O Select character orientation on each 90 degrees from each other.

BOX, X1, Y1, X2, Y2, pen Draw a box X1, Y1 being the bottom left coordinates, X2, Y2 being top right.

INITIALISE Return to origin and reset pens and character sizes.

OFFSET, X, Y Move the origin to X, Y

Most of these commands are similar to those used in BBC Basic, so translating pictures drawn on the screen to the plotter is quite straightforward.

The major drawback with this plotter was its lack of speed, but adjustments were possible via the SPEED command. If the drawings were to be at all accurate, the best thing to use was the slowest possible speed which, for some drawings, meant leaving the system to get on with the job and coming back three to four hours later.

The opto sensor system is set up by replacing one of the pens with the sensor and using the supplied software. The computer then scans the picture line by line and transfers the monochrome result onto the screen. The best results were obtained with pictures that had a sharp black and white contrast although, with a little software aid, the results can be improved dramatically.

The milling attachment is meant to be used with polystyrene sheets but produces pretty good results with baked clay. It has the advantage of being an educational tool as well as good fun. A full scale computerised milling machine can cost anything upwards of £10,000, but a simple plotter costs about £17.50 with a router attachment. The latter can therefore be used to demonstrate all the principles and their results at a 20th of the cost.

Another attachment is a scribe which can be used to engrave glass or scraper board. The best effects were obtained with mirror tiles. These were first coated with nail varnish and, after scribing, placed in etching fluid.

Verdict

The best feature of this plotter is its versatility. It is possible to attach virtually anything to it that needs to be transported over a set X, Y area. At £310.50 for the basic model and £563.50 for the full kit including driller/router, opto sensor power supply and scribe, it is quite cheap compared with the competition. Though it could be more accurate, it is still more than adequate.

SOFTWARE

• WHAT'S NEW • WHAT'S NEW • WHAT'S NEW •

Note to software publishers: If you wish your company's product to be included, please send only the very latest releases to Bryan Skinner, Software Editor, PCN, 62 Oxford Street, London W1A 2HG, and please don't forget to include prices and a telephone number.

Games

Roomlord from Paramount is a multi-screen arcade/adventure which is far from easy. You control a figure which bears more than a passing resemblance to one of the heroes of Atic Atac and have to collect heirlooms such as tiaras and guitars from the 16 rooms. Having entered a room you are faced with numerous hazards and can only leave by being killed or collecting the treasure. You can destroy the guardians — dragons or cowboys — by throwing your Magic Star.

Havoc comes from a new software house, Dynavision, and is rather like *Zaxxon*. You fly a fighter across a scrolling city-type landscape, dodging through narrow apertures and evading oncoming fighters and falling bombs. The graphics are well done, but the joystick response is sluggish.

Trollie Wallie is Interceptor Micro's follow-on to *Wheelin' Wally* and *Wallie goes to Rhymeland*. In it you guide Wallie on a shopping spree through a department store,

avoiding obstacles on the way. Wallie has to collect forty items, but he can only carry five at a time and once this limit is reached he has to go to the checkout to pay for them.

Software Projects, now importing games from the USA, is also licensed to convert games for a variety of machines. One of its first imports is *BC's Quest for Tires* — a very strong contender for PCN's oddest title of the month award. The game is from Sierra-On-Line which produces top-quality games for the 64, Apple and Atari. Software Projects also has arrangements with such famous names as Broderbund and CVS Technology. The arcade game *Hunchback at the Olympics* from CVS will soon be available on the Spectrum and the 64.

Poltergeist for the Spectrum will soon be available and takes place in a 15-room house. You must visit each room, avoiding household objects which begin to move around as you progress. Your aerosol can of holy water will deter the poltergeists, but is easily exhausted. Should you come face-to-face with the phantom itself, you will need at least a quarter of a can of the deadly stuff to exorcise it.

Forest at World's End is a graphics adventure in which your task, as the mightiest of

ancient warriors, is to rescue the princess Mara from the clutches of the evil wizard Zan. The phrase analyser looks impressive. It allows you to use adjectives and compound commands.

Avalon is Hewson's latest and will be released on September 16th. Billed as 'the adventure movie' the company claims that it represents a major breakthrough in programming technique as the first adventure game with three-dimensional graphics. Like *Valhalla*, it will allow real-time player interaction with the characters and we will be bringing you a full review as soon as we get our hands on it.

On the prize front, there is *Quo Vadis* and *Starbike* from The Edge. *Quo Vadis* (Latin for 'Where are you going?') offers you the chance to win a Golden Sceptre. A graphics adventure, the game requires you to find your way through caverns, killing some of the 38 animated monsters, and solving riddles which will help in the search for the Magic Sceptre. *Starbike's* prizes include a free subscription to Computer and Video Games, free cassettes or a BMX bike. Unusually, you do not even have to play the game to win — each cassette comes with a number which offers you the chance of winning. The Edge call *Starbike* a 'space

arcade adventure' and your brief is to collect lost aliens from various planets, avoiding or destroying interstellar flotams and jetsam.

Utilities

Spectrum Sound Effects comes with 50 noises such as Car Engine, Lazer Zaps and Penny Whistle. The package allows you to develop complex sounds on the Spectrum, and save them to tape for later use in your programs.

The Memotech **Utilities** package is very cheap and contains programming tools like a Renumber routine, binary/hex/decimal conversion, 40 column text and data save/load.

The **QL monitor** will prove an invaluable aid to 68008 programmers. It allows you to examine the contents of addresses, insert memory, search for strings or hex numbers, compare, move and so forth. KAT is also producing a character generator for font designing.

Triptych's releases for the Spectrum, 64 and BBC include **Entrepreneur** which will help you to learn about planning business ventures and includes information about working capital, break-even points and profit and loss. On a lighter note, **Star Watcher** lets you plot the 1500 brightest stars and will help you learn to identify the constellations. PCN

PHILIPS

Every small business can be a step ahead with The Philips Portable Computer P2000 C

The P 2000 C goes from desk to desk providing computer efficiency to many people in a small company. The P2000 C portable is easy to move and can be set up in a flash. And it is easy to use even if you have never used a computer before.

A secretary can type with the P2000 C just as with a typewriter only it's faster, easier and better. You can organize your records with it, do forecasts, projections and estimates, analyze

your costs and prices. The accountant can do his bookkeeping and billing and keep track of outstandings. In fact any business task can be done more easily and quickly.

Feature Highlights

1. 37" screen, 240 x 60 character display, high resolution graphics, 32 KB video memory
2. 64 KB RAM of user memory, 256 KB RAM disk optional
3. Two 5.1" floppy disk drives with up to 640 KB per disk. Hard disk interface (HDDSI) with built-in hard disk also available.
4. Low profile keyboard.
5. CP/M* and p-System** as operating systems. This provides access to a vast range of available application programs.
6. Standard interfaces: serial printer, external floppy disks, data communications, slave monitor and hard disk.
7. EIC/IEEE interface optional.
8. 16 bit "Co-Power" Board optional.

* CP/M is a trademark of Digital Research Inc.
** p-System is a trademark of Soften Microsystems Inc.

P2000 C - the affordable portable.
From £ 1350 plus VAT, including CP/M, WordStar, CalcStar and SAGE "Try-before-you-buy" Accounts Packages.

Resulting 8/16 bit system will
run both 8 and 16 bit software

Versatile McVid

This machine code graphics utility achieves a great deal with only 1.5K, says Simon Williams.

This time last year presented few offerings for the programmer who wanted to experiment with machine code sprite routines on the BBC micro. Since then with many new programs issued, routines of this type have become comparatively commonplace. Some have been listed in the magazines. So a new program, especially at the fairly hefty price of £14.95, has to offer different angles to justify itself.

Features

The main difference between McVid and other graphic utilities is that it is intended for the machine code programmer and not the writer of Basic games, although Basic can be used to control the routines. As such, it has to fit into the category of program that is sufficiently useful to the machine code author that he/she would rather make use of it than write routines from scratch, tailor-made to a particular application.

McVid offers routines to handle line drawing, sprites and screen scrolls to left and right. Separate sets of code are supplied for each of the BBC's graphic modes, not just Mode 2 as is often the case. Collision detection is provided in the line drawing routines, and drawings may also be scaled up and down, and rotated. The code for all these functions occupies only 1.5K plus the shape data.

Presentation

McVid is very professionally finished and comes complete with a glossy covered, ring-bound manual by author Jim Gray. As well as the individual routines for each graphic mode, both tape and disk versions include a demonstration program which has a lunar module rolling in to land on the surface of a moon, before splitting in two and disappearing back to a full colour home planet, which has been slowly passing across the screen.

The lander is a multi-coloured line image which grows and shrinks realistically on its two journeys, and the whole demonstration finishes by scrolling the scene rapidly left and right before repeating. A rather unfortunate after-image of part of the lander remains after it has blasted off, but the whole demonstration certainly shows McVid in good light. The majority of the demo is written in Basic and is listable.

Documentation

Pica seems very fond of offering listings, since half its manual consists of a printout of the routines involved in Mode 5. Although this is well annotated, it is really not sufficient instruction in the use of the program. Description of the line drawing routines runs to only three A5 pages and that for the sprite routines to only four. Quite a lot of information is contained within this space, but it is awkward to extract, and only for the experienced.

Documentation often used to be considered a necessary annoyance by software houses, but most have now come to appreciate what a real affect it can have on sales. I feel Pica could have done a lot more to explain its product.

In use

To use either the line drawing or sprite routines, a corresponding table of shape start addresses must be set up in memory. Page &900 is used for this and puts an overall restriction of 256 bytes on the address table. This translates to a maximum of 32 sprites or line drawings in use at any time. Page &900 is normally used for sound envelopes 5 or 16 or the speech processor buffer, so using either will overwrite the shape table.

The routines use other areas of low memory, in particular &90 to &96, part of the area in page zero reserved for the Econet system. Choosing these areas is sensible, as they are unlikely to be used on

machines whose main purpose is developing games software.

Each line is described by three bytes of data, its colour and the X and Y coordinates of its finishing point. The line drawing routines assume that each line starts from the end of the previous one. This is an economical way of doing things, although it does, of course, limit the length of any individual line to 255 units. Two re-usable graph sheets are included in the manual to assist with shape and sprite design. The shape data bytes themselves may be stored at any convenient point in memory.

Sprites are defined in a similar way to line drawings, using the second half of page &900 to hold their address table. Each byte of the shape data holds information about the colour and position of the sprite bytes and they are, of course, configured differently depending on the graphic mode in use. These bytes require some pretty complicated setting up and I believe the package should include a sprite and line drawing definer to take the hard slog out of the procedure. Just because the package is intended for the machine code programmer doesn't mean he or she should be expected to work it all out by hand.

None of the extra facilities provided by other sprite packages—such as animation, choice of size, preset routes—are provided directly by McVid, although the structure of the package allows these features to be written by the programmer. It does require some detailed knowledge of machine code programming to do this efficiently, however.

The fast scrolling routines give true scrolls—without every column on the screen moving up a line each time it reaches either edge.

Verdict

There's no doubt that McVid provides versatile routines for handling line drawing and sprites from within machine code or Basic. To do what it does in 1.5K is quite a programming achievement, but I feel Pica is severely limiting its potential audience by not including a character/line definer and by not properly describing the routines in the accompanying manual.

For sufferers of PCNitus THE PCN BINDER

Since March 1983, a mysterious malady has afflicted thousands of people in Britain—PCNitus. The symptoms are perplexing. . . Those afflicted are found fighting their way through piles of Personal Computer

News magazines muttering strange things like 'can't find the Electron Pro-Test' and 'The Spectrum Micropaedia must be here somewhere . . . But a recent breakthrough has brought instant relief to PCNitus sufferers. The cure is called the *Personal*

Computer News binder. It's red, yellow and silver and holds four months' copies completely flat, even when full. You'll be able to read them easily and refer to them quickly.

So if you recognise the symptoms above — take the cure now!

Just fill in the coupon at the bottom of the page and send it with payment (£3.50 inc postage, VAT and handling) to the address below.

BINDER ORDER CARD. Please rush me _____ PCN binder(s) at £3.50 each. I enclosed my cheque made payable to Personal Computer News. Please charge my Access/Visa/Diners/American Express card (delete where not applicable)

Comal 80 is ace for structured programming on the 64, says Barry Miles.

Comal 80 is a cartridge which will be released in the near future by Commodore for the 64. Comal stands for Common Algorithmic Language and is designed to be better than Basic or Pascal by combining the best features of both of them, and being extremely user friendly into the bargain.

In use

When the language is in the machine, you still have 40K of memory available for your Comal program. In addition, some 12K is available for use by machine code programs.

Comal is the Basic to end all Basics. It makes teaching yourself programming an easy and enjoyable experience. It scores highly compared to other languages because of its very strict adherence to the principles of structured programming and its amazingly helpful error correction and detection features.

No stone has been left unturned to make this language extremely easy to learn. Not only do you write your programs quickly, but they will be running correctly far sooner than with an unstructured Basic. This is made possible by a pre-press system in which the syntax of every statement you have entered is checked and errors are pointed out in detail.

A truly structured language such as Comal imposes constraints and reduces the liberty with which you can plan and design your programs. However, it also stops you from concocting such convoluted code that no-one but yourself can understand it.

Comal, being pre-compiled, is an extremely fast language in operation. Searching 1,000 strings to see whether any one of them contains a particular sub-string is 1,000 times faster with Comal than it is using the Commodore 64's normal Basic with the MIDS command.

The cartridge contains no less than 11 separate modules which can be invoked with the command USE, so you might say USE GRAPHICS in order to invoke the graphics pack.

When the 64 was designed, no effort was made to enhance Basic to include appropriate graphics keywords. With Comal's interrupt-driven sprites you can set sprites in motion, carry out some other activities in your program while the sprites continue to move, and then interrupt their movement at will. This means that writing games in Comal will be a good substitute for writing games in assembly language and the results will be almost as fast. Similar interrupt-driven treatment is also given to the sound commands. Sound routines can be written so music plays while the rest of your program is running.

Programming in Comal is pure delight. The AUTO command produces automatic line-numbering, but line numbers are always four digits long, so 10 becomes

Comprehensible Comal

0010. As you write your program, the interpreter or compiler works in such a way that indentation of appropriate structures is automatic. The indentation provided by Comal is more powerful than it seems because, by looking down a listing, it's very easy to see whether or not you've closed off the structures you've started. Also, the language will tell you that you have failed to complete a particular construction and will display the offending line.

Reference to the manual is infrequent because the language itself will tell you where you are going wrong. Editing commands include RE-NUMBER, FIND, SEARCH, REPLACE, and DELETE, and you can delete or list procedures by name.

Structures

A 'procedure' is a piece of code which carries out a particular function. It has one entry point and one exit point only. In Comal, procedures can either be open or closed. In the case of a closed procedure the variables in it are local to that procedure. The significance of this is that you can import procedures from your library of routines, or from someone else's, knowing that there will be no clash of variable names. The process of building up your program then becomes one of joining together a series of procedures from various sources to form one major procedure which carries out the task.

This greatly facilitates structured programming using the top-down method. The top-down method defines the problem to be solved as a series of tasks. Each task may be divided into a group of sub-tasks and

on. You continue this process of 'stepwise refinement' until the list is so detailed you can simply write the code to do each part.

Translated into the Comal environment this implies writing your main program as a list of procedure names. You then write the procedures and test each one. Once the testing is satisfactory, you can put all the procedures together to make the program.

It is said that the single most effective enemy of good programming is the GOTO command. Tracing the flow of events through a program involving many GOTO's is frustrating. Comal avoids this by calling up blocks of code by the name of the procedure and by parameter passing.

IF... THEN, ELSEIF and ELSE are provided, as are full looping structures. DO WHILE, DO UNTIL and a CASE structure have been borrowed from Pascal. Armed with these programming tools it's extremely simple to program in a straightforward manner so that anyone reading the program can see exactly what's involved.

Verdict

Comal revolutionises the Commodore 64. It makes learning structured programming easy and the speed with which the graphics, sound and other parts of the language operate implies that machine language will rarely be required. And if the price is right this package deserves to be highly successful.

COMMODORE 64

ATARI

Stellar System

Name Stellar 7 System Apple II series and Commodore 64
 Publisher Penguin Software Format Disk Price \$29.95 Outlets Retail.

It takes a good game to capture the imagination of PCN's team of jaded games players. Stellar 7 managed easily.

Objectives

Those awfully nasty aliens are invading Earth again and you're our last hope. The only chance of success lies in your vehicle, the Raven.

You begin in our solar system and have to fight off sufficient enemy units to find the Warp-link, a sort of Einsteinian awayday ticket that whips you off to distant corners of the galaxy. You must do battle in six systems before arriving at the alien stronghold.

In play

Those of you who remember Battle Zone from the arcades will be on familiar ground here, although Stellar 7 is a better game in many respects. What sets it apart from the run-of-the-mill action games is the attention to detail. You can select joystick or keyboard control, read a mission profile or go straight into the action.

A display of the opposition units is contained in a separate file and there are some touches of humour here. You can review all of this material between games, or skip it if you wish, although it contains some useful clues.

You begin on Earth beneath a blue sky inhabited by flying machines. A range of mountains sits on the horizon with the ground littered by large blocks and land vehicles. The blocks act as obstacles to movement but also offer some protection against enemy fire.

The rule at this stage is simple: if it moves, blast it. On the right of the screen two indicators show your energy supply and shield strength. Every hit you sustain reduces your shields by about a tenth.

When things get hairy you can invoke your Inviso Cloak. The screen display becomes an eerie black and red and you can prowl around in comparative safety, but it consumes energy at an alarming rate.

If you can zap about 150 points-worth of alien equipment a Warp-link will appear and this will transport you to Antares where even more aliens await. Next stop is Rigel and your first intermediate objective — a refuelling pod.

As you progress, the opposition gets tougher. The graphics are splendidly conceived and executed in wireframe style, and the animation is quick and smooth.

Verdict

Definitely a game for the connoisseur — a fast trigger finger isn't enough, you must think as well.

Overall value

Ewing Feud

Name Dallas Quest System Atari 32K Price £12.95 Publisher US Gold, Centresoft, West Midlands 021 520 7591 Format Disk Language Machine code Other versions Commodore 64 Outlets Retail

Y'all gonna have a mighty big prablem when you arrive at Southfork. Sue-Ellen has a proposition for you which JR ain't gonna like.

Objectives

Jock Ewing left a map of a new and rich oilfield with his old chum and former wildcatter, Chugalug Jones, who now runs a trading post in South America. Sue-Ellen wants you to get the map for her so that she can become financially independent of JR. But she's got to beat JR to it.

In play

Dallas Quest is a traditional text adventure complemented by high quality graphics and occasional sound effects.

Each location is impressively depicted in high resolution, filling the top half of the screen. What's more, certain objects in the picture disappear and reappear as you take or drop them. The text area occupies the lower half of the screen, the picture staying put until you move to another location. You can enter text-only mode by typing PICTURE, — the same command brings the graphics back when you want them.

To make life easier, the game offers numerous clues, but will

allow you to access only up to nine of them in one game. The number of clues available is displayed at the top beside an indicator of possible exits from the current location.

The familiar theme tune trumpets out and you find yourself in the living room at Southfork, with Sue-Ellen sitting demurely on the sofa. Your first major problem is getting out of Southfork — JR just might have hired some burly ranch-hands to watch out for you. If caught, you'll see a giant fist crashing towards you before everything starts to go black.

Once in the South American jungle, you'll meet a delightful monkey with a habit, and I don't mean clothes. Watch out for a cannibal chief since there's more to him than meets the eye.

Not all the objects you find will be of use, but it's up to you to discover which are the red herrings. It's a good-humoured adventure — try blowing the bugle, firing a rifle, or feeding the horse.

Violence is almost non-existent so, with the availability of a large number of very helpful hints, Dallas Quest is an ideal adventure for the family.

Verdict

Undoubtedly the best designed graphics I've seen in an adventure. It's a jolly yarn and one which will give a lot of pleasure whether you're a Dallas fan or not.

Lasting appeal

Playability

Use of machine

Overall value

'Will you still love me when I'm 464?' Simon Williams looks at old favourites on the Amstrad.

Amstrad editions

An old computing proverb states that any machine is only as good as the software it will run. In the case of the Amstrad CPC 464, the first programs to become available from the company's own software house, Amsoft, are almost exclusively games. They are all priced at £8.95, a good deal more than equivalent programs for other machines. How, then, do they compare?

The first thing to note about this batch of software is that it is composed largely of conversions of successful programs for other machines. There is nothing necessarily wrong with this, as it is a good way to attract potential buyers. It may, however, mean that the full features of the new machine are not fully used, especially if the conversions have to be hurriedly programmed.

Amsoft has taken the unusual step of setting itself up as an umbrella organisation to handle the marketing of programs produced for the 464 by several well-known software houses.

HARRIER ATTACK

With successful versions of this program for the Spectrum and Oric already available, the 464 version from Durell Software offers all the features of the original, plus better sound than the Spectrum version and four realistic colours.

It's awkward having to use the space bar to drop bombs even when controlling your plane with a joystick. If using the keyboard, an immediate advantage is gained over a Spectrum game in the response of the excellent keyboard on the 464.

I was annoyed that the range of my missiles seemed shorter

than that of the enemy planes, and that I only got one plane. But at several million pounds each, I suppose that was only fair.

MASTER CHESS

Every good micro should have a good chess program and Micro-Gen's version will give you a challenging game (rather too challenging for my standard of play).

It offers ten levels of play, which determine the ply of search the program uses. An opening book of some 6,000 moves is written in and on-screen tally is kept of the past 13 complete moves. The colours of both sets of pieces and the board may be changed at any time and chess puzzles may be set up.

If requested, the program will offer a best move at any point. But whenever I used it, it seemed to suggest moves decidedly more favourable to its own strategy.

The only other point against Master Chess seemed to be its inability to recognise mate. I had to abandon several games when I had no valid moves and was in check, but was not mated.

ELECTRO FREDDY

Soft Spot has produced several well-written programs for the BBC micro and three, including *Electro Freddy*, have been converted for the Amstrad. Freddy, according to the cassette insert, is a kind of urban guerilla bent on preventing Uncle Claude Sincrum from upping the price of his products and causing redundancies at his factory.

The chosen method is to push everything on screen onto the despatch conveyor before Claude can get his hands on you. You do this in a vaguely Pengo fashion, while avoiding Claude, the spectrums he throws at you and the oracs that are periodically dropped from the roof.

Each screen uses a different product, from computers to alarm clocks to trannies, and the game gets harder with an increasingly complex warehouse layout and the introduction of a force-field between Freddy and the conveyor. The chunky graphics move well and, while not the most complex game in the world, *Electro Freddy* is a lot of fun to play.

CODENAME MAT

This Micromega Spectrum hit converts well to the Amstrad machine. Complicated, it combines the best qualities of both strategy and arcade games.

It's something like the Atari classic *Star Raiders* to play, itself similar to *Star Trek* with real-time arcade elements added to make it more exciting. Where *Codename Mat* scores over either is in the quality of the graphics (attacking ships, bolts, asteroids and star gates) and the facility to direct allied

fleets against the enemy as well as zooming around the solar system shooting up anything that comes within range.

I can't claim to have mastered this game; it takes a lot of practice and I find the speed controls particularly difficult to use effectively. It is only too easy to enter an area under attack and streak straight past the enemy without firing a shot.

HUNTER KILLER

This game of submarine warfare was originally written for the Spectrum and published in a monthly computer journal. It proved so popular that the cassette of the game achieved success in its own right, and now Protek has converted it to run on the CPC 464.

The game plan takes place off the coast of Germany and Denmark during the second world war. The player is in command of an S-type submarine with orders to disrupt enemy submarine traffic in the area.

The screen depicts the control room of the submarine, complete with radar, Asdic, charts, periscope and numerous digital readouts. Control of the sub is complex and you will have to put in a fair amount of study, just as for a flight simulator, to be able to control the craft properly.

It's worth the effort, though, since *Hunter Killer* can generate a feeling of high tension during a close run game.

All the games are available from retailers or from Amsoft, 169 Kings Road, Brentwood, Essex. Tel 0277 230222. Prices £7.50 to £8.50.

Title: Snake
 Machine: Atari 800
 Language: 6502 machine code
 Application: Game
 Author: FM O'Dwyer

An old favourite arcade game has been zapped up for the Atari. Written in machine code, Snake, by FM O'Dwyer, will need all your skills to keep ahead.

Control is via a joystick in port 1 of the Atari and using this you can guide the snake around the screen aiming for the numbers which appear from time to time at random positions. If you are unsuccessful the number changes into a deadly obstacle.

It is therefore wise to try and get all the numbers, even if they are a low value, or you will be constantly obstructed. For some reason it seems far easier to bump into the obstacles than the numbers.

If you do manage to get to a number before it changes, your length will increase by an equivalent number of segments. Points are scored each time you get a number. You must also be careful not to bump into your own tail and this gets increasingly difficult as you grow.

If you go off the edge of the screen you wrap around, which is quite confusing with the game so fast. Just when you think you know where you are, you are suddenly whisked over to the other side of the screen. Obviously a great deal of practice is required.

You gain a life every 1000 points. Pressing START starts a new game and pressing OPTION allows you to change the speed of the game. A check sum is included in the program to ensure you type the data statements in correctly.

Program notes

- | | |
|----------|--|
| 100 | Sets up the screen for the introduction page. |
| 110-190 | Prints instructions. |
| 200 | Closes and opens the keyboard and gets input. The close is executed first to make sure there is no open error. |
| 210 | Prints 'please wait' as data is being loaded. |
| 220 | Reads in the number of data statements for use in line 330. |
| 230 | Reads in start and end address data. |
| 240 | Converts the four eight-bit numbers to 16-bit addresses. |
| 260 | Reads in data. |
| 270 | Checks the number of data statements to make sure they are all there. |
| 280 | Checks sum to ensure data has been input correctly. |
| 290 | Turns off any current sound, selects the graphics screen mode, and executes the machine code. |
| 300 | Checks the flag and reset A if not set. |
| 310 | Set the flag. |
| 320 | End of subroutine. |
| 330-1890 | Data for the machine code. |

B.C.'S QUEST FOR TIRES™

Can Thor save Cute Chick from the hungry dinosaur? Only you can help. At first he only has to jump rocks and holes. Then he must jump and duck, almost simultaneously, to avoid the logs and low hanging tree limbs in the Petrified Forest.

The only way Thor can get across the river is to hop on the turtles' backs. These turtles sometimes get tired and submerge at the wrong moment, much to Thor's dismay! To add to Thor's difficulties, his arch-enemy Fat Broad is waiting on the other side to ambush him.

If Thor's timing is good, the Dooky Bird will help him over the lava pit. If he jumps the pit just when Dooky Bird is overhead, the prehistoric bird will pick him up and carry him across!

Thor must build up plenty of speed during his downhill run before the cliff. Timing is crucial, too. If Thor's balance is off or he is too slow he will crash into the ravine or the face of the cliff.

Once over the cliff, Thor faces his most difficult challenge: the volcanic eruption. In addition to the obstacles on the ground, he is showered with boulders from the sky.

Once again Thor must cross the river on the turtles' backs. Then, at last, he must face the dinosaur!

If Thor can get past the dinosaur and into the cave, he has only a short way to go to rescue Cute Chick. On his way, Thor must duck under stalagmites and jump over stalagmites to avoid crashing.

If Thor does crash, don't worry; he has five wheels. But True Love is calling him, so use all your agility and cunning to help him rescue Cute Chick!

64 AT ITS BEST

Let's Set Willy

THE FOLLOW-UP TO THE NUMBER 1 COMMODORE 64 GAME MANIC MINER

Miner Willy, intrepid explorer and nouveau-riche socialite, has been reaping the benefits of his fortunate discovery in surbiton. He has a yacht, a cliff-top mansion, an Italian housekeeper and a French cook, and hundreds of new found friends who REALLY know how to enjoy themselves at a party.

His housekeeper, Maria, however, takes a very dim view of all his revelry, and finally after a particularly bolsterous thrash she puts her foot down. When the last of the louts disappears down the drive in his Aston Martin, all Willy can think about is crashing out in his four-poster, but Maria won't let him into his room until ALL the discarded glasses and bottles have been cleared away. Can you help Willy out of his dilemma?

He hasn't explored his mansion properly yet (it IS a large place and he HAS been VERY busy) and there are some very strange things going on in the further recesses of the house (I wonder what the last owner WAS doing in his laboratory the night he disappeared).

You should manage O.K. though you will probably find some loonies when I was up on the roof and I would check down the road and on the beach if I was you.

Good luck and don't worry, all you can lose in this game is sleep.

Send a large stamped addressed envelope for more detailed information on our new releases, plus a free large poster.

DEVPAK £14

An excellent assembler, an advanced line-editor, a comprehensive disassembler and a superb 'front panel' debugger all in one package. Used by many leading software houses to write their games. "Buy it!" Adam Denning 1984.

PASCAL £25

A powerful and almost full implementation of Pascal - not a Tiny Pascal. A valuable educational and development tool, programs typically run 40 times faster than a BASIC equivalent. Spectrum version includes Turtle Graphics package. "I haven't seen any other compiler that could match Hisoft's Pascal"

Dunstable, Beds. LU6 1AT
Tel: (0582) 696421

HISOFT

for the ZX Spectrum

Hisoft is pleased to announce a new compiler for this popular and effective systems programming language. Not a tiny-C but an extensive, easy-to-use implementation of the language. Allows direct execution of compiled statements. Supplied with function library. Available direct from Hisoft for £25, or write for further details.

All prices, UK delivered, relate to 48K ZX Spectrum versions. Our software is available for many other Z80 machines e.g. Amstrad CPC 464, MSX, Memotech, SHARP MZ700, New-Brain, CP/M etc. Please write for details.

The Cancer Research Campaign's COMPUTER USERS ADDRESS BOOK

Support the work of The Cancer Research Campaign by purchasing one or more of our Computer User's Address Books. A5 in size and printed on high quality art paper and board, the Cancer Research Campaign's Computer User's Address Book contains a combination A-Z address and contact listings section together with a representative products and services guide to suppliers.

We confirm that the full purchase price of the Cancer Research Campaign's Computer User's Address Book will be retained by the campaign without deduction.

To: The Cancer Research Campaign 2 Carlton House Terrace London SW1Y 5AR

Please send me _____ copies of the Cancer Research Campaign's Computer User's Address Book at £2.95 per copy (including post & packing) each. I enclose my payment for £ _____

Name of company/firm _____

Address _____

Name of individual purchaser _____

Telephone no. _____

Santa banter

Ho, ho, ho, boys and girls, only three months left until Christmas and Tatung is already making free with silly publicity photographs. Can Santa grow a beard by Christmas?

What we want you to do is put words into Mother Christmas's mouth or a caption to the picture, and send it to PCN at Evelyn House, 62 Oxford Street, London W1A 2HG. The finest example of sparkling wit wins £20 in this Laughline competition — we'll announce the winner in issue 81.

SLANTAX ERRORS

There were several errors in the listing of Cupid Bounces Back in the programs section of issue 75.

The title in line 80 should be 7. The title in line 1600 should be a 2. Line 530 should end `GOTO 510`. In the data starting at line 540 the line numbers for the check sums have been repeated and you must change these to 645 instead of 650; 755 instead of 760; 865 instead of 870 and so on.

Finally the direct command which moves the machine code to a different location (printed at the bottom of the text) should be entered as two lines returning after the first NEXT A.

Zircos Software, producer of *Thermonuclear War* on the Dragon, caught some fallout from its mention in last week's Software Preview. Its telephone number is 01-986 3369, not 3368 as printed.

Rade Systems' R-50 route to CP/M for BBC users (Monitor, issue 76/15 on sale now; the mid-November launch date we unaccountably gave it is just four months late).

Issue 75's Charts mistook Ocean's Decathlon for Activision's in an illustration.

NEXT WEEK

Hands up — How small can micros go? We have the answer, with Pro-Tests of hand-held micros from Casio and Psion.

Two's complement — Ashton-Tate's dBase III gets the twice-over in this review.

64 and more — We show you how to order your Commodore 64 about with this survey of available commands.

Gameplay — Reviews of the latest games for the Commodore 64 and the Amstrad CPC-64.

Programs — Another nail in the coffin of the old English pub — we offer you dominoes on the Spectrum.

Switched-on to innovation

Here it is at last, the ultimate computer peripheral. Computerworld has just launched a reset-switch box for the Spectrum, Oric/Atmos, and Electron.

This mind-blowing bit of kit, which features a plastic ABS box with a superior on/off switch, saves wear and tear on the power plug of these machines. One special feature is its availability in three different colours, red, black, and white, to allow tasteful matching to your machine.

The most amazing thing about the reset-switch box is the price, a snip at £4.49.

PCN thought it should be easy to design a cheaper, do-it-yourself version so here goes. It consists of a switch. It's that easy. A variety of these are available, but it should be possible to pick one up at the nearest Woolworth store for a modest sum (certainly under £2). The best kind is one with screw connections so you don't have to do any of that nasty dirty soldering.

PCN DATES

PCN Datalines keeps you in touch with up-coming events. Make sure you enter them in your diary.

Organisers who would like details of coming events included in

PCN Datalines should send their information at least one month before the event. Write to PCN Datalines, Personal Computer News, 62 Oxford Street, London W1A 2HG.

THE SERIES THAT MAKES THE QUANTUM LEAP

THE SINCLAIR SERIES QL

"I am certain that these books will add enormously to the enjoyment and practical use which QL users will get from their computers."

NIGEL SEARLE

Managing Director, Sinclair Research Limited

5 books to help you get the most from the QL, whether you are still waiting or are lucky enough already to have yours.

Introducing the Sinclair QL explains how the QL works and what you can do with it.

Introduction to SuperBASIC on the QL explains SuperBASIC and introduces its special features and qualities enabling you to master programming quickly.

Advanced Programming with the Sinclair QL is an essential reference work for users who really want to get to grips with the Sinclair QL. The book includes such topics as program logic representation, types of commercial program, programming techniques and document design.

Desk-top Computing with the Sinclair QL shows just what can be achieved in business computing using the Sinclair QL and how to get the best out of the four QL software packages: word processing, spreadsheets, database management and business graphics.

Word Processing with the Sinclair QL has been written to explain both the concepts behind the uses of word processing and how the QL word processing package operates and what it can do.

General Editor, Robin Bradbeer and his team of authors received the help and co-operation from both Sinclair and Psion Software – creators of the QL software – to ensure that these books really are the ultimate handbooks for QL users.

Order now – you won't have to wait long for your books! Just fill in the order form and return it to us with your cheque or money order. You can even charge your Access or Barclaycard account. We will send you your books POST FREE within 28 days.

THE FIRST GENERATION of Eye-friendly Filters.

Treat your eyes to a Romag CEAF. Only £19⁹⁵

Unique technology: British made laminated glass, aspherically curved Contrast Enhancement Antiglare Filter.

Up to now, contrast-enhancing filters have always been flat—and so has their performance, because the screen of your TV, monitor or VDU is curved.

Up to now, most filters have been plastic—because it takes mindbending technology to bend optical-quality laminated glass.

Up to now, filters have been expensive—awkward production techniques have meant price tags from around £50 to well over £100.

Forget all that: the Romag CEAF is here. British designed and manufactured by space age military technologists, CEAF is profiled to fit your display screen, giving you the ultimate in contrast enhancement and antiglare performance. For under £20, this first generation of eye-friendly filters diffuses all specular reflections, gives sharper image clarity from edge to edge of the screen and greatly enhances display colours.

Mounted and removed in seconds by invisible velcro fastenings, the anti-static, anti-shatter CEAF is a major step forward in the operational safety of

computer displays—unprotected screens can cause blurred vision, watery and itchy eyes, headaches and (according to such authorities as the Institute of Ophthalmology) even permanent changes in eyesight.

Scratch-resistant, durable and easily cleaned without expensive sprays and agents, 9", 12" and 14" CEAFs are available from leading retailers at only £19.95 including VAT.

Or fill in the Freepost coupon and your CEAF will be despatched within 48 hours. Orders can also be placed around

the clock by phoning the CEAF Department on (091) 414 5524, quoting your Access Card number. For other screen sizes, please ring or write—the CEAF prices for 'specials' would be considered very competitive...if there was any competition!

To FREEPOST ROMAG, CEAF Dept. PCN, Blaydon on Tyne, Tyne & Wear NE21 5SG. Telephone: (091) 414 5524
