ROBOTS COME HOME

Get to grips
with the BBC Micro

•• MAY WICO BE WITH YOU ••

When you're up against all the evil in the universe, you need the finest joystick. Weak, sticky, slow controls can only lead you to your doom.

You need a Wico.® The controls in more than 500 modern arcade games are actually made by Wico.® They set the industry standard for durability and performance. And the same arcade quality goes into the Wico® you take home.

Wico® joysticks work directly with the Commodore 64,™ Vic 20,™ all Atari® Home Computers and Atari® Video Games.

Add an interface, and you can connect into a Sinclair Spectrum or Apple II® and IIe.® If you have a new MSX computer there's the just released MSX Grip Handle for you.

What do you get? A man-sized handle on a virtually unbreakable shaft. Tough, ultra-sensitive Wico® switchgear. A heavy-weight base. A year's guarantee. And more sheer

dodging, chasing and blasting power than ever before.

The Wico® range includes the famous Red Ball,™ straight out of the arcades. The Three Way Deluxe with interchangeable handles. The light but rugged Boss. And check out the state-of-the-art Trackball: many owners use it for serious programming, where it gives them effortless cursor control.

Ask your dealer to let you handle a Wico.® Quality (you'll find) costs money.

But if you want to have less trouble fighting your controls, and more power for fighting the forces of darkness . . . only Wico® is worthy of your hand.

WICO®

THE FINEST HAND CONTROLS
IN THE KNOWN UNIVERSE

COVER STORY

COMMODORE hits back 2

In the face of last week's onslaught from Atari, Commodore has re-grouped. It can't match Jack Tramiel's new outfit for numbers, but the three new systems demonstrated as far apart as Las Vegas and Birmingham will carry its standard into battle this summer.

OUTPUT

SPECTRUM novelty 10

The character set on your Spectrum can come in all shapes and sizes with our routines to interface to Basic programs.

Coca-Koala 12

It's the real thing, a program to let Commodore 64 owners turn their Koalpad graphics tablets to something more inventive than pretty doodles.

BBC assignment 16

Brush up your BBC Micro's trigonometry with this sine curve program to add to your wayly line store.

HARDWARE

SHARP scores 24

With an 8086 and an NEC graphics chip, the Sharp MZ5600 looks fast enough to give most of its rivals in the PC stakes a run for their money — and GEM is on the way.

PERIPHERALS

Present Arms 30

We put robots on parade with an inspection of arm-waving machines from Colne Robotics and Fischertechnik. They may not change your life but you should discover what your right Armroid's for.

COMPETITION

Win a SPECTRUM disk drive 33

We've got together with Spectrum dealer Micro Interface to offer you the chance of winning one of three superb Timex disk systems. Throw some salt over your shoulder, spit three times for luck, and give it a whirl.

SOFTWARE

Astronomy Domine 38

We check out three programs for serious star-gazers. Will they eclipse Elite? Can they outshine Star Wars? Judge for yourself.

Grand alliance plots IBM's fall

Digital Research has announced a project that may do to IBM what DR's GEM threatens to do to Apple's Macintosh.

DR president John Rowley told a seminar in London that

patible, to run IBM DOS applications unmodified.

The occasion of the announcement was billed as 'a joint seminar' held in London, Tokyo and New York by DR and Intel. The three-day international event gradually emerged as a platform from which DR, Intel and several other collaborators launched an attack on IBM's near-monopoly.

Sharing the platform in London were ICL, Software Products International (producer of Open Access on the IBM PC), and Professor Martin Healey of the University of Wales. In New York Ashton-Tate joined in.

Most direct of the speakers was Ninian Eadie, director of ICL's office systems division, who termed IBM's market position 'not healthy for the industry or the end user'.

John Rowley summed up the promise of the 80286/Concurrent DOS projects 'compatibility with IBM and, at the same time, it will open the door to innovative system designs'.

ICL and Acorn, on its top-of-the-range ABC machines, have already signed high volume licences for Concurrent DOS-286 which DR intends to ship before June this year.

his company will release an upgraded version of Concurrent DOS to run all software written for both PC DOS and Topview without modification.

Dubbed Concurrent DOS-286, it is a dedicated operating system for Intel's 80286 microprocessor — the powerhouse in IBM's AT machine. DR says: 'Concurrent DOS-286 will open up the market significantly by enabling systems which are based on the 80286, but which are not necessarily IBM com-

Microvitec moves to touch screen tutoring

Touch screen technology is set to invade the nation's classrooms. Microvitec, manufacturer of the top-selling monitor in schools, today (Wednesday) unveils the Touchtech 501.

At £210 (plus VAT) the Touchtech is a stand into which a standard metal cabinet Microvitec monitor is fixed, with a screen bezel which houses infra-red sensors.

Infra-red beams are projected

across the front of the monitor screen and the sensors detect when the beams are broken. The exact coordinates are fed back to the serial port of the micro.

The system is ideal for software involving a choice between one or more alternatives.

The Touchtech 501 works with the BBC Micro; models to work with other popular micros are in the pipeline.

Atari's new stars due for spring UK debut

Atari's Las Vegas show-stoppers could be in the UK as early as April at prices close to straight \$1/£1 conversions.

The six new micros from Atari's US stable (issue 95) are due to make the UK journey by May according to the company's UK subsidiary. But one of Atari's leading UK distributors, Silica Shop, is giving an April date for the machines to make their appearance.

A spokesman from Silica revealed that he expected the XE 8-bit range to be available in late April with the ST range following shortly.

On pricing he said: 'We estimate the XE range to sell from around £150 to £400 and the ST

range won't go above £700.' This would be virtually a \$1/£1 conversion from the prices announced in the US.

In fact, Silica expects to sell the 65XE for under £150, the

Atari 520ST — spring launch. 65XE with a music synthesiser for less than £400 and at the top end of the XE range the 128K 130XE and the 65XEP nearer the £400 mark.

MONITOR: CES

Commodore covers new angles at Vegas

We make no apology for taking our coverage of the Las Vegas Consumer Electronics Show into a second week. There was too much on show to do it full justice last week — and the Commodore machines in particular deserve a closer examination.

One of the biggest disappointments was the non-appearance of Amiga's Lor-

a vastly improved version of the old Commodore 64's Basic 2.0. Not only can the 7.0 handle sprites and high-resolution graphics from Basic but it has a number of structured features that computer buffs love, such as DO — LOOP and BEGIN — END.

There is 64K of ROM for the 128 mode: 48K for 7.0 Basic and 16K for the improved Disk Operating System.

The 64 mode is 100 per cent compatible with the Commodore 64, ensuring a whole range

machine has not just one, but two compatibilities.

The 128 will be selling at around \$300 from this spring and every indication is that the 64 will be reduced. There is uncertainty over what will happen to the Plus 4 and C16.

Commodore is also joining the lap-held bandwagon by releasing the Commodore LCD. Weighing approximately 3lbs, the Commodore LCD has an 80 by 16 column liquid crystal display which is bigger than Epson's PX-8.

It runs on the CMOS 65C02 which is yet another version of the 6502 and has 96K of business and telecommunications software. The LCD also has a built-in 300 baud modem and runs on rechargeable batteries.

LCD has Basic 3.6, and 32K of CMOS RAM. The keyboard is strange. The photographs in press hand-outs showed a normal full-travel keyboard but when the machine turned up at the show it had different, flat-tish, keys.

The 128 and LCD indicate that Commodore is moving out of the games computer market into middle of the road business computers. The departure of

Spectravideo showed their latest MSX with disk drive included and most of the manufacturers are hoping to launch these 'value added MSX' systems in the US.

Although most manufacturers will not comment on launch dates or prices, Harry Fox, founder of Spectravideo and now a spokesman for Microsoft commented that MSX will definitely be launched in the United States this autumn at prices between \$200 and \$300. He said that as most American manufacturers are moving away from the lower end of the home computer market, MSX will soon dominate the field.

Panasonic, Sony and Pioneer now have video superimposition units and video editing facilities for MSX. Pioneer made an impressive demonstration of its MSX laser disk system, Palcom, which showed a new game called Star Fighters produced by ASCII's high technology laboratory. Star Fighters has graphics generated by a super mini VAX 11/780 with the MSX game itself superimposed on top of the computer generated image, recorded on the laser disk.

Trim peripherals — Commodore's add-ons for the C128.

raine, the 16-bit computer acquired by Commodore, but it showed two new products which both look like winners.

The Commodore 128 is a triple processor computer with 6510, 8502 and Z80 microprocessors. Like the Atari STs, the 128 has a professional keyboard with numeric keypad

of games software for the 128 before its launch.

It also supports all the 64's peripherals, so 64 owners can upgrade their machines without having to throw away peripherals and games.

The third mode is CP/M, running on a Z80A processor. The Commodore 128 will there-

Commodore LCD — great white hope in the light-weight division.

and a whole new range of peripherals.

When switched on, the computer initialises to 128 mode which has 58K RAM available for Basic text and a further 64K for variables and data storage. This is run by Commodore's new 8-bit 8502, which is compatible with the 6502 (BBC Micro) and 6510 (C64's cpu). The Basic is version 7.0 and is

fore able to run business software such as Wordstar and dBase II.

The 128 is a revolutionary machine for Commodore. First, the 128 has an improved Basic. Second, and most important, the 128 is compatible with other computers. Commodore has always made its machines totally incompatible with anything else in the field, but this

Sinclair's radio wrist-watch — stealing the QL's thunder.

CBM from this field is a perfect opportunity for the MSX crowd to move in.

MSX circus hits town at last

After all the will-they-won't they speculation, the MSX circus hit Las Vegas by showing a whole range of computers. Microsoft played host to almost all the MSX manufacturers in Japan, Holland, Korea and the US. The MSX stand was saturated with computers in many variations.

The current trend in MSX is to have a built-in 3.5in disk drive. Sony, Panasonic and

Of all the manufacturers, New York-based Spectravideo showed the largest number of products. Spectravideo now has MSX Express which is a full 64K RAM computer with a 3.5in disk drive built in. Also it has RS232, 80 column card, and modem cartridges. Spectravideo was the first to announce a Local Area Network (LAN) for MSX which enables 32 systems to be connected.

Toshiba showed the follow-up to its HX10 MSX computer, the HX-22. This has much better styling than its predecessor and has a word processor written by Broderbund Software. Toshiba's machine is said to be ready but it is waiting for

other manufacturers to launch their products in the US.

Sony and Panasonic displayed similar machines, both with separate keyboards and built-in disk drives. Philips' latest VG8020 48K MSX was also on show for the first time.

The MSX stand also hosted three software companies, Infocom of Zork fame, Lisp Company and Nexa Corp. Infocom displayed its latest interactive detective game called Suspect.

The Lisp Company showed its Logo, which it claims is faster than Digital Research's DR Logo. Nexa Corp also showed an impressive F15 Combat flight simulator.

Konami had a large stand adjacent to MSX's, showing six new MSX games.

Not to be outdone by Epson and Commodore, NEC laun-

\$100 when it goes on sale in the US later in 1985.

The watch component includes all standard time and calendar functions, 24 hour alarm with hour chime, and light. The radio operates on a 1.5 volt battery housed in the watchband's clasp.

The radio antenna is entirely self-contained inside the watchband. The miniature loudspeaker eliminates the need for a separate earphone.

Sinclair has also announced that the QL will be on sale for \$499. US sales will be conducted exclusively via mail order from Sinclair's US office in Boston but in this age of mass marketing and high performance machines like the Atari ST and Commodore 128, QL may turn out to be doomed from the beginning.

The one and only British

An Apple a day keeps rumours at bay

An old favourite has just been re-issued from the State Rumours and Baseless Predictions Department. Apple won't survive 1985, it says. The same thing was said this time last year but 1984 didn't rhyme with 'survive' so nothing came of it.

It's comforting when life is predictable in this way. Old Moore could put a regular insertion under January in his famous almanack: 'Heavy snow blankets Whitney; royal corgis whelp; doomsayers point finger at Apple Computer.'

It's a measure of Apple's success that the competition should regularly claim to detect signs of terminal illness in the company. The Mac can't succeed, they cry, and then they rush out to implement Digital Research's GEM so that their systems look like a Macintosh. They already looked like an IBM PC because IBM compatibility takes less in the way of imagination.

Apple's prospects for 1985 are a matter of reasonable public interest, but it's unfair to single Apple out as the runt of the litter. You could make a case for any number of micro makers coming under a lot of pressure in the next few months, and there are better reasons than an intuitive leap for doing so.

The falling pound, for example. It may not be having much impact over in Cynical Valley, land of high technology and constant sunshine, but in the UK there will be pricing policies in tatters all over the country.

The one dollar pound has been a fact of life in the micro industry for a long time, but that dates back to when the pound stood above \$1.40. When the official rate starts to draw close to £1=\$1 something will have to give.

Anybody who imports systems or components will have noticed the difference. In most cases they'll be paying in dollars, which is to say that they'll

be paying more for the same goods.

The most obvious way to keep the existing profit margin on what they sell is to bump prices up to compensate — but the trend over the whole industry is in the opposite direction. Prices fall regularly. The competition for sales is so intense that a price increase from one company would probably drive it immediately out of business. Go to the wall, go directly to the wall, do not pass Go...

There isn't any prospect of safety in numbers; the manufacturers couldn't orchestrate a coordinated price rise to protect themselves. Even the MSX manufacturers found their members breaking ranks when the general level of prices looked unacceptable. In the business micro market if IBM was to put up the price of its PC, one or two others might get away with following suit. The rest would simply increase their production and rub their hands happily.

So the companies are faced with a dilemma. Their costs are rising but their prices are already under pressure — downwards. Some of them will already be operating uncomfortably close to the edge of unprofitability, cutting corners wherever they can just to stay in business. Many will have few opportunities of improving productivity and absorbing the extra costs that way.

For a while, they may be able to absorb these costs and keep prices competitive by cutting their mark-up. The unofficial cost of building a Macintosh is \$500 — if that figure is accurate Apple still has some room to manoeuvre. But it isn't a recipe for long-term success. The next generation of machines is developed from the profits made by the present generation.

Under these circumstances, the most diversified companies have a clear edge. A computer maker that also produces (for the sake of argument) a best-selling roller-skate powered by a hair-dryer motor might be able to cover a loss on his computer operations from the profits on his roller-skates. Big companies can erect similar bulwarks by drawing on reserves set aside for those rainy days.

But companies with only one line of business and one main product could be in trouble. Maybe that's why people always pick on Apple, whose UK boss David Hancock admits that a lot depends on the Macintosh. But it's obvious that a number of other companies are going to feel the cold winter chill before Apple does.

David Guest

Sticking its NEC out — Nippon Electric launches the 8401A and friends.

ched a follow-up to the much-acclaimed PC8201. The new PC8401A is a battery-powered lap-held with 64K RAM. The LCD screen is 80 by 16, which is the same size as Commodore LCD and twice that of Epson's PX-8. The screen is placed inside a lid which protects the keyboard in transit.

The PC8401A also has a 300 baud built-in modem and telecommunications software which can emulate a DEC VT100 terminal. It's a CP/M compatible machine, and Wordstar and Personal Filer are included in ROM.

The price is set to under \$1,000, similar to that of CBM LCD and Epson PX-8.

The biggest surprise for any British visitor to CES was undoubtedly the Sinclair wrist-watch radio. While Sinclair announced its 'car' in the UK, here at CES it gave a preview of the world's smallest FM radio.

British presence is worth watching

The biggest surprise for any British visitor to CES was a compact FM radio. The result is a totally portable radio time-piece which will sell for under

software house at CES, Mastertronic, introduced a range of arcade games on disk for the Commodore 64. The price is set at \$9.99 which sounds incredibly expensive by British standards but in the US it is seen as a major price breakthrough for computer software. Previously most 64 games sold for around \$20 to \$30.

The first ten games to be launched in the US include Chiller (without Thriller) and Monty Python's The Quest for the Holy Grail.

The company has already sold 140,000 programs since its October debut in Canada and hopes to repeat the success in the US.

A new Silicon Valley company called Sonitrupe showed an unusual device called a Space Tablet. This comprises a receiver frame that can be placed on top of the computer display and a pencil-like pointer (transmitter) that you hold.

It acts like a light pen but the receiver frame can detect the position of the pen in three dimensions using ultrasonic waves.

This ingenious device is to be marketed in Britain by Dragon off-shoot Touchmaster.

MONITOR: WHICH? SHOW

'Shy' Commodore PC has nothing to hide

The Mad Hatter is alive and well, if Commodore's Alice in Wonderland performance at last week's *Which Computer?* Show is anything to go by. The company had its new PC-compatible up and running, but wasn't saying anything about its price or capabilities, so you could play with it provided you didn't mind Commodore not telling you how to play with it.

Similarly, although a 'full support package' for the machine was unveiled to existing dealers, Commodore wouldn't say what the package comprised. If it's at all exciting we'd be happy to hear from tame Commodore dealers...

Commodore is apparently sensitive to allegations that it has pre-announced products in the past, and has therefore gone over the top on the rebound by installing padlocked zippers on mouths throughout its public relations department.

The box, however, looks nice, if a trifle large, and those nice people at Commodore are prepared to admit it's a 16-bitter.

From other sources we can tell you that the Commodore PC has plenty to be shy about. Its 8088 runs at 4.7MHz, its 256K of RAM can be expanded to 640K, its 12in monochrome

Commodore PC — cloak of secrecy.

monitor offers 640 by 200 pixels, and there are five expansion slots besides parallel and serial interfaces. You can have two 360K floppies or one floppy and a 10Mb hard disk. This combination sounds depressingly familiar.

The machine is due to be launched in the spring as part of Commodore's 'offensive' on the UK business market. It looks as though it could get stuck in the mud.

Toshiba inscrutable about new releases

Toshiba made its entry into the business computer market with two machines: the T1100, a 7lb portable and the T1500, a

desktop IBM compatible machine. Both are built around the 8088 processor.

The T1100 comes complete with 256K of memory and an 80 character by 25 line liquid

Toshiba T1100 — no tosh here. crystal display.

The larger T1500 desktop claims full IBM compatibility and has 128K RAM, either dual 5.25in floppy or floppy/hard disk drives and, unlike the IBM, a colour graphics interface is included as standard.

Ascertaining prices for these machines was a process fraught with difficulty. Without a translator present, the charming and helpful Toshiba representatives chose to answer every enquiry whatever its aim with the words: 'IBM compatible'.

Leather-bound ABMs whip market

Not everybody's approach to IBM compatibility was as lacklustre as Commodore's. ABM Computers had luggables starting at £1,095 in three styles — leather-bound, Kaypro-clone, and specially toughened.

These are called respectively the Ambassador, the Envoy and the Commando. They're driven by 8088s with 128K and twin 320/360K floppies at the bottom of the range.

Through its Far Eastern connections ABM also imports two desktop machines from Sun Electronics — the Suncat PC6000 and PC6700 are also MSDOS compatible.

But the company aims to build systems in this country.

NZ2600 — Shary's new micro (issue 91) made its first public appearance at the show. Look out in a forthcoming PCN for a full Pro-Test. The machine couples NZ2700-compatibility with Personal CP/M, and falls into the home/business range of the QL and the Plus/4.

Tandy all-in-one best yet to come

Tandy has unveiled the latest addition to its wide range of business microcomputers. The Model 1000 compares very favourably with the IBM PC, with a lower price and colour graphics supplied as standard.

For £1,099 the Tandy 1000 has an 8088 processor, 128K RAM (expandable up to 640K) and a double-density 5.25in disk drive giving 360K of storage when formatted.

Included in the price is Deskmate, which gives you a simple word processor, electronic spreadsheet, filer, communications program, diary and mail package.

It is not intended to compete with the larger packages that are about, such as Lotus 1-2-3, but is designed so that any one who buys the machine will be able to use it without having to spend any more money.

But the version of MS-Windows that graced the 1000 on the Tandy stand is still not the polished production version. Summer is the best guess on the availability of Microsoft's elusive Windows.

Sagesoft/OCF drive for Sinclair

Sagesoft is a company with designs on the QL — Sage Accounts will shortly be available through Sinclair at £289.95, including VAT. This may seem an unpleasantly high price to you, but versions for the more conventional business machines come in at £375, so the QL program is something of a bargain.

Sagesoft will also be converting its payroll program, and is working on an unspecified non-business project for the QL.

Meanwhile, Oxford Computer Publishing provided the vehicle for the first showing of

the Abbeydale Designers' SPDOS disk drive for the Spectrum, which is being marketed by Watford Electronics. OCP revealed its 'silicon office' concept, which is intended to turn the Spectrum into a business system, and which is based around SPDOS.

The first disk program out of the traps is Stock Manager, which is to be followed shortly by Purchase Manager and Sales Manager.

OCP wins the accolade of being one of the first companies giving software support to SPDOS, the other notable being HiSoft, which is scheduled to issue its Pascal program in SPDOS format.

TI MSDOS shows friendly front-end

Fronting up the Texas Instruments stand was the Prolite portable, launched in the UK ten days ago. But TI also demonstrated some of the fruits of its extravagant spending on artificial intelligence — a natural language front-end to MSDOS and an expert system on a micro.

TI's argument is that systems that treat you like an idiot are fine when you're finding your feet, but after six months it may become a little tiresome. So its friendly front-end to MSDOS is something that you can switch in and out of.

Not that you have to type in complete English sentences to work your way through it — the selection of English commands is by a rotating series of menus. It costs £75.

Antipodean micro stages a return

There wasn't a tiny of Fosters in sight on the Australian stand, but the Dulmont Magnum has found a UK distributor and could soon be a regular feature of trade shows.

Professional Micros, of Longstanton, near Cambridge (0954-81991) is supplying the £2,195 portable in this country. The machine, with an 80186, 96K of CMOS RAM, 128K of ROM, and a flip-up 80 by 8 LCD screen, weighs about 8lbs and runs MSDOS.

Trilex puts colour into its Doodles

Back on the genuine IBM front, Trilex was showing a colour version of its Doodle Computer Aided Design package for the IBM PC and Olivetti M24.

Doodle is a competent design package, and it is compatible with IBM DOS files. It costs around £600.

IN BRIEF

DK Tronics, new owner of Currah Computer Components (issue 95) is now putting the finishing touches to Currah's Micro Source. This high level assembler for the Spectrum was the last product Currah was working on before it went under. DK Tronics says that Micro Source will be available in a month, with versions for other popular computers following later.

Cheetah will donate all profits from sales of its game *The Perils of Bear George* to the Ethiopian famine relief appeal. Universal Software is also chipping in £1.50 from each sale of its £2.99 *Starship Adventure* game for the Dragon.

Lynx fans with that neglected feeling can take comfort from a new surge of interest in their micro. Phoenix Software (no relation to the now-defunct Phoenix Software) is releasing *Jet-Set Willy* at £7.95 for the 48K and 96K Lynxes. A version for the 128K model is on the way. Phoenix (0928-35525) claims the support of Romik, Gem and Level 9 in its effort to give the Lynx the kiss of life.

Database Software's Mini Office — rated 'quite exceptional value' by PCN's reviewer in issue 93 — is due out in new versions for the Amstrad and the Commodore 64. The package gives the user a rudimentary word processor, database, spreadsheet, and graphics for an amazing £5.95. The new versions should be on sale by the end of the month through Boots and WH Smith.

Software Projects and Ocean have patched up their differences over the use of the Hunchback character in computer games. Ocean has withdrawn its legal action against Software Projects and has allowed it to go ahead with its Hunchback at the Olympics game. In return, Software Projects has acknowledged that Ocean owns the copyright to Hunchback and will not be producing any other games featuring the character.

There are now more 16-bit micros being launched than eight-bit machines. Who says so? BIS-Peddar (01-633 0866) which publishes a Quick Reference Guide to microcomputer systems. According to its latest figures there are now 295 eight-bit micros on the market, 185 16-bit machines and 71 32-bit machines. Depressingly, 64 micros are described as being IBM compatible. In 1984, 191 new micros were launched of which 88 were 16-bit and only 64 eight-bit.

QL — one today, jam tomorrow

Sinclair is celebrating the first birthday of the QL with acres of advertising and proud promotions. Keen wait-watches will notice that the company has lost none of its '28-day delivery' panache.

'See how far we've come,' says Sinclair as it details the software and hardware available planned for the QL. Languages from Metacomco, Computer One, Micro APL and GST. Applications from Psion, Harcourt and Accountancy Software. And a range of peripherals from Kaga, Quest, CST, Miracle Systems and Sigma Research.

However, the hard disk 'available shortly from Quest' is still some way off delivery. 'We don't know when it will be available,' said a Quest sales executive.

Similarly, Quest's memory expansion boards are still in the pending category. The 64K and 128K boards are due 'any day now'. But the 512K board is in the 'don't know when' category.

Interestingly, the peripherals and add-ons from Quest and other third party suppliers cover almost exactly the list of products that Sinclair implied at the QL launch that it was developing itself.

The non-availability of the hard disk is particularly intriguing. For the rest of the software and hardware Sinclair could suggest that it was always intended that they would be developed by third parties.

But Quest's Firefly, of course, can only be used for CPM and not QDOS. So how much longer will users have to wait for a version that works with the QL's own operating system?

And for a machine that has been around for a year there is still a depressingly small amount of software around. As recently as November, Sinclair was issuing to the press information claiming that 'the extensive hardware development is paralleled by extensive software development activities involving over 200 houses'.

Sinclair is still making promises of goodies to come. Two things are now certain about QL software, 'the advert claims. 'First, there's going to be plenty of it. And second, it's going to set completely new standards for microcomputers...'

'At the moment, there are well over 100 software programs in development,' it proudly trumpets.

Nice to know there's jam tomorrow...

Sinclair milestone marked by gold QL

Are you one in five million? If you own one of Uncle Sir Clive's micro marvels you are. Sinclair celebrated the sale of its five millionth micro at the *Which Computer?* Show last week by holding a free raffle for a gold painted QL. Well, it perhaps makes a welcome change from 'you can have any colour providing it is black'.

Micro Power hurls down the gauntlet

Probably the most challenging game ever devised for the BBC Micro'. That's Micro Power's catch phrase for Castle Quest, and from what we've seen it's not far short of the mark.

Micro Power is staking a lot

on the game; there's a £500 high-score competition and if you crack the game within three months of purchase, Micro Power will pay you £1. Mind you, the game cost £12.95, so a less-than-10 per cent refund isn't much to write home about.

The game is basically an arcade platform affair, with some unusual features. There are a number of problems to be solved which require rather more thought than normal arcade games.

Research Machines cuts disk prices

School micro specialists Research Machines (RML) has cut the price of its hard disk drives. A 10Mb Winchester and controller now costs £2,344 and a 20Mb Winchester and controller costs £2,771.

The controller can handle up to four Winchesters and RML is quoting £1,536 for extra 20Mb drives. The prices don't include VAT, so they still look overpriced. But schools do get an educational discount.

Users preferring to opt for high capacity floppies might like to know that RML has cut the price of its quad density drives to £924 which is only £125 more than the cost of RML's double density drives.

JEKYLL AND HYDE — With the flick of a switch Truedata X Switch allows you to swap add-ons from one computer to another. Costing £113 for an RS232 mode and £136 for a Centronics mode, it allows up to two computers and two add-ons to be hooked up to the box. The Truedata switch from DNCS (0706-67567) is reasonably priced compared to Immac's devices of the same ilk. Immac's Centronics box costs £258 and its RS232 £223. In addition, DNCS has a 32K buffer-to-T-switch up for grabs for anyone with an RS232 interface on their micro. It costs £228.

EXCITING NEW SOFTWARE FOR YOUR MICRO

Doctor Who and the War Lord
An intriguing text adventure featuring the quirky and irrepressible Doctor. It increases in difficulty as the adventure unfolds, presenting a real challenge to the player.
BBC Model B: Cassette
£7.95

Loco Motion
A remarkable animated game that gives the player control of a train travelling around an extensive network comprising about 50 screens.
BBC Model B and Acorn Electron: Cassette
£6.95

Pantry Antics
A fast, amusing and addictive game. The player takes the part of a mischievous mouse, running along the pantry shelves and earning points for each piece of crockery knocked over.
BBC Model B: Cassette
£6.95

White Knight Mark 12
A new, more powerful version of Martin Bryant's award-winning chess program. It includes a 'save-game' facility and other useful features.
BBC Model B: Cassette
£9.95

Vu-Type Disc
Vu-Type is an exciting personal aid that teaches you to touch-type without tears, using colour graphics, sound and musical tones. It is now available in a disc based version.
BBC Model B: Disc
£18.40 (Cassette version still available: £16.10)

Vu-Type Professional
An enhanced and expanded version of Vu-Type that includes many new Pitman-approved exercises and comprehensive documentation.
BBC Model B: Disc
£21.95 (approx)

All software is for the British Broadcasting Corporation Microcomputer except where indicated.
Prices include VAT. Available from booksellers and computer shops.

Game for a Memotech . . .

I was most surprised to read your answer to the enquiry for a computer offering backgammon, chess and bridge (issue 93).

As the only magazine, in my brief experience, to print Memotech listings, I would have expected you to recall that this excellent machine can also offer pontoon, blackjack, draughts and reversi, as well as the three requested.

However, please carry on the good work with, perhaps, a games listing or two, to convince the computer buying public that the one reason for not buying a Memotech, ie lack of software, no longer exists.

DR Jones,
Kingham, Oxon.

. . . and holding the key to the MTX

Although the technique for reading the Memotech keyboard described by Keith Hook (issue 75) is fast (in machine code) and detects multiple key presses, it is still cumbersome to work out the sense-bytes for each key. This is especially true when ASCII values are required for the key currently depressed.

In cases where multiple key presses aren't needed, a call to the system ROM at address #79 (decimal 121) returns to the ASCII value of the key being pressed in the accumulator. Before calling this routine #FD7C must be cleared, for example:

```
xor a clear accumulator
```

ld (FD7C),a
call #79 get ASCII of current key
This returns the ASCII value of the current key or '0' if no key is being pressed. The routine preserves all but the AF registers.
*Nic Joynton,
Christchurch, Dorset.*

Unravelling another link in the chain

I am glad that Mr Smith (Random Access, issue 94) gained some intellectual stimulation if not practical application from my article, Unchaining VU-FILE (issue 86).

He is quite correct in saying memory can be further saved by the use of VAL (I had a 1K ZX81 too). However in order to support a second Microdrive you would have to find another 595 bytes — no amount of VALs and SGN Pls are going to achieve that. It was my intention to make the conversion as simple as possible.

However I think it's time for PCN to bend over and take a few lashes — the confusion over the filenames is due to a couple of misprints. To clear up any confusion there are in fact two mistakes. There should be a space between VU-CODE and MD in the SAVE . . . CODE statement, and as Mr Smith points out, VU-File should be VU-FILE.

Oh, and before the eight thousandth person tells me that it is much easier to convert VU-FILE with Trans-Express — I know, but I wrote the article before Trans-Express was launched.

*Carl J Laurenson,
Prescot, Merseyside.*

List Basic variables in Amstrad programs

The following short Amstrad CPC 464 routine is a useful debugging tool. It lists the lines on which a Basic variable has been used. Merge the routine into the working program, and activate with RUN 6530. Alternatively, use it as a subroutine by changing the END keywords in lines 6530, 65410 and 65440

byte) and Y(hi byte). Lines 1060 and 1070 overwrite the operand in line 1110 with X and Y (ie HIMEM). Lines 1110-1160 effectively POKE zeros into the screen memory.

To use the routine simply replace any CLG command with CALL&900. Should you wish to relocate the routine elsewhere, you must reassemble it.

Stephen Baker,
St George, Bristol.

a search through the range of Basic program lines specified for occurrences of a text string containing the specified vari-

able name, with bit 7 set in the last character.

D Bright,
The Hague, Holland.

to RETURNs.

The routine prompts for the name of the variable, and for the line numbers at which to start and stop searching. If null replies are given for the limiting line numbers, the entire program is searched. For each line on which the variable is used, the line number and the number of occurrences is printed.

The routine simply performs

New year cash for winning wave

The winner of December's Microwave of the month is James Bridson of Culcheth, Warrington (issue 92). His BBC disk routine allows access to any individual sector so as to write a copy of the sector to the buffer.

Beeb window gets sideways scroll

A sideways scrolling screen within a window is possible with this machine code program for the Beeb (see page 8).

A normal window in the BBC is set up with the command VDU 28, LEFT X, LOWER Y, RIGHT X, UPPER Y and vertical scrolling is easily carried out by a succession of VDU 13 commands.

For right to left scrolling, however, a different solution is needed.

The data in line 10 holds the parameters for the machine code in the same format as the VDU 28 command above. This can be altered to whatever values you require.

A word of caution: if the screen display has scrolled due to text filling the screen the addresses used by the code will be wrong — with unpredictable effects. The routine is for mode 7 only.

Jeff Tullin,
Gateshead, Tyne & Wear.

COOL CHARACTERS

Expand your character sets with these machine code listings by Ben Willcocks.

This machine code program for the ZX Spectrum can be used in conjunction with Basic to print the standard character set in several expanded formats.

To promote this easy interfacing with Basic programs, a novel method of transferring data has been employed; certain Basic variables are reserved for the control of the machine code program, and the latter searches the variables area to obtain the necessary data.

Extensive details of the way in which the Spectrum Basic system stores variables are to be found in chapter 24 of the user manual; however, to summarise, the variables are stored immediately

above the Basic program, starting at the address given by the system variable, (VARS), and terminated by a byte #80.

- There are six different categories:
- Numbers with single-letter names.
 - Numbers with names longer than one letter.
 - Number arrays.
 - For-next loop control variables.
 - Strings.
 - String arrays.

It is not difficult to distinguish between them, as the first byte of each category has a unique range of values (see the manual, pages 122 to 124), but a search of the variables area will be far from simple, because the different lengths of the different categories must be taken into account. Fortunately there is an easy way to achieve the search. It is

obvious that the Basic system will need to search the variables area; therefore the ROM must contain a routine for this purpose. The routine to use is at address #19B8. It is entered with HL pointing to the first byte of a variable, and will return with: HL unchanged; DE pointing to the first byte of the next variable; BC — the length of the variable 'skipped'.

With this routine at hand, searching becomes easy; to find a number variable, for example 'x', the first bytes of each variable are checked until a byte #78 (ASCII for 'x') is found, or until #80 is found, in which case the end of the variables area has been reached. The code for a string will be #20 less than the corresponding code for a variable (eg 'xS' will be #58) — see Figure 1.

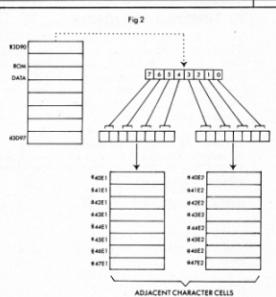

Fig 1

In Figure 1, you can see a comparison of variable and string codes.

Program notes

- PRIN (04000)** Print character and attributes at position (HORI),(VERT) in mode (MODE). Increment (HORI) and (VERT) as appropriate. If co-ordinates are out of range, reset them to 0,0.
- PRLN (05010)** Print a line of the display file. If in double width mode, this will be two bytes. On entry, BC points to the ROM data, DE points to the display file.
- PRJL (05260) / PRJR (05300)** Double up left / right nybble of A, to fill all of A.
- PRAL (05410)** Put value of A into attribute location addressed by DE; if in a double width mode, do the same for the next attribute on.
- EXCH (06000)** Exchange the values of the program variables (HORI),(VERT), and (MODE) with the values of the basic variables h,v,&m respectively. If any of the latter are not found, return with the carry flag set.
- FIND (08000)** Search variables area for the variable (or string) defined by the contents of A. If found, return with HL pointing to the number data (or 1st character of string). If not found, return with the carry flag set.

This is an example of doubling up the data.

The screen file occupies addresses #4000 to #57FF. The usual style of character cell on the Spectrum is 8x8 pixels; 8 bytes in the screen file are thus required for each cell. The addresses are not allocated sequentially. The screen is best thought of as three blocks corresponding to rows 0 to 7, 8 to 15, and 16 to 23 (the latter contains the 'messages' area). These blocks occupy addresses #4000 to #47FF, #4800 to #4FFF, and #5000 to #57FF respectively. For each block, the LS byte of the address defines the cell, and the eight possible values of the MS byte define the lines within the cell. For example, the cell corresponding to the position of "PRINT AT 10, 10" uses addresses:
#484A

- #494A
- #4A4A
- #4B4A
- #4C4A
- #4D4A
- #4E4A
- #4F4A

The data for the character forms is stored in the ROM, from #3D00 for 'space', to #3FF8 for '©', eg to print '©' normal size, the eight bytes #3FF8 to #3FFF are simply transferred to the eight bytes constituting the required cell.

If we wish to print double height characters, two vertically adjacent cells are used, and each data byte is inserted twice. To print in double width format, it is necessary to 'double up' each of the two nybbles of the data and then insert them

in horizontally adjacent cells, for each of the eight lines. Figure 2 shows an example of this process.

The Basic program should set up the following variables: h (Horizontal print coordinate); v (Vertical print coordinate); m (Mode; 0=Normal, 1=Double width, 2=Double height, 3=2x2).

The text to be printed must be put in $\$$. Note that: $\$$ must be a normal string as opposed to a string array; and that h, v, and m must be integer values, and set up as normal variables, not by means of FOR-NEXT statements.

The attributes used will be those current at the time, as for normal PRINT operations. The machine code is run by RANDOMIZE USR 6000. The code could, of course, be assembled at a different address.

The Koalpad is a popular and versatile graphics tablet for the Commodore 64; but with a bit of inventive programming, it can be used for something more than just drawing pretty pictures. The touchpad can be utilised as a set of function keys to widen the range of options at your fingertips, not to mention saving wear and tear on the fingertips themselves.

After some experimentation, I found that the optimum number was four across and eight down, giving a total of 32 keys available for programming (one of these keys is dedicated as an Enter key, as discussed later).

Using the program

Load the program, either with a machine code loader of your choice, or with the Basic loader listed (those of you without disk drives and assemblers will have to use the Basic loader), and enable the software either by typing RUN with the Basic loader, or by a SYS or similar for the Basic loader. Then, all you will need to do is press the appropriate area on the touchpad, which will show the chosen key function on the top line of the screen. To execute the command, the top left area on the Koalpad will need to be pressed.

All that remains is to make an overlay for the touch sensitive area of the touchpad with all the commands written on it. It should be possible to write program to produce hard copy from a printer with all of the commands on it, (and send it in to Microwaves, maybe?).

How it works

The program links itself into the 1/60 second interrupt vector, and does its own processing before returning control back to the operating system's interrupt routines. It takes the X and Y coordinates of the pressed area of the touchpad, and rationalises these to

For use with the BBC Computer. Metal shaft, 2 fire buttons

£12.95

PM C16 CASSETTE DATA UNIT

Designed for use with Commodore +4, Commodore 64 and Vic 20. This cassette unit is a device for storing and recalling computer programs on ordinary cassette tapes. It can be used for saving programs you have written and want to recall for later use. It can also be used to read pre-recorded programs that you have purchased.

£24.95

DUST COVER

Clips onto the back of the Commodore 64. Pivots up to allow use of keyboard, fully moulded, clear plastic dust cover.

£7.95

SINE LANGUAGE

Speed up your calculation of functions on the BBC with this program from Pete Johnson.

The trigonometric functions SIN, COS and TAN in BBC Basic have many uses, eg in plotting graphs and working out rotations in shape plotting. However, the speed at which Basic calculates the functions leaves a little to be desired, and for high-speed work the programmer has to resort to look-up tables.

This article describes one such look-up technique. Listing 1 is written in 6502 assembly language, provides the following features:

- 1 Sines of 0-360 degrees obtained using only 91 look-up values.
- 2 Results returned are accurate to 16 bits or about four decimal places. This is ample for most applications.
- 3 The routine may be called from machine code with the angle to be used in the A and X. The result is

returned in AX and is SIN (angle) * &8000.

- 4 The program may also be called from Basic with a statement of the form CALL getSine, angle%, sin where angle% is any integer variable and sin is any real variable. Again, angle% is between 0 and 360 degrees, and the result is automatically scaled to a real, so that the CALL statement may replace an assignment such as sin=SIN(RAD(angle)).
- 5 The calculation is performed on average 18 times faster than the Basic's built-in sine routine.
- 6 The routine doesn't call Basic internal routines so is compatible with all variations of Basic and also works with the Tube.

The main sine routine starts at line 1760. This uses the look-up table at the

label sinTab to find the scaled sine of the angle in AX. The actions for the four quadrants are:

- 0-90 degrees The sine is simply looked up from sinTab.
- 91-180 degrees the identity sin(a)=sin(180-a) is used. 180-a is in the range 89-0 degrees, so once the subtraction has been made, the routine for 0-90 degrees is called to obtain the result.
- 181-270 degrees To obtain the result, the identity sin(a)=-sin(a-180) is used. First 180 is subtracted to obtain an angle between 1 and 90 de

To the left is a Sine wave, to the right is a Tan wave.

2260 ]
2270 NEXT pass

```

271-360 degrees

gress. The sine of this is found using the 0-90 routine, and this result is then negated.

The relationship this time is $\sin(a) = \sin(360-a)$. Again, the subtraction is performed, then the sin is obtained, then it is negated.

The relations described above may be neatly summarised with the Basic function:

```

1000 DEF FNsin(th%) IF th%<=90 THEN =SINRADth% ELSE IF th%<=180 THEN =SINRAD(180-th%) ELSE IF th%<=270 THEN =-SINRAD(th%-180) ELSE =SINRAD(360-th%)

```

You may notice the slight 'fudge' in the code to set up the sine table at lines 2190 on. The sines for 0 to 89 degrees are obtained as expected, by multiplying the value returned by SIN by &8000. However, the sine of 90 degrees is obtained separately after the main loop.

The reason for this is the non-symmetry of two's component numbers: the sine of 90 is 1, therefore the entry for 90 degrees should be $1 * \&8000$, or 32768. However, &8000 is in fact -32768 in 16 bits. The table uses the largest positive integer which is &7FFF instead. This doesn't cause any problems in practice.

The Basic interface to the sine routine starts at the getSine. The steps per-

formed are:

- 1 Get the address of the first (integer) parameter in ptr.
- 2 Get the lower two bytes of this integer in AX. This should be in the range 0-360.
- 3 Call sin to obtain the scaled sine in AX.
- 4 If the result is negative, take its absolute value and remember that it was negative.
- 5 Convert the scaled integer into a floating point number. To understand how this is done, a knowledge of how BBC Basic stores floating point numbers is required.
- 6 Store the result in the second (floating point) parameter.

All this is performed between lines 1120 and 1600. To see the program in action type it in, run it and then try the

following benchmark:

```

A=0
TIME=0:FOR A%=0 TO 360:CALL getSine,A%,A:NEXT:PRINT TIME
Compare the value printed with that obtained using:
A=0
I=0:FOR A%=0 to 360:A=SINRADA%:NEXT:PRINT TIME
To compare the accuracy, try: A = 0:
@%=&20409
FOR A%=0 TO 360:CALL getSine,A%,A:PRINT A,SINRADA%:NEXT

```

Finally a note about cosines. It is true for all angles that $\cos(a) = \sin(a+90)$ where a is in degrees. Thus, a cos routine could be incorporated by including the lines in Listing 2.

Similarly, a Basic getCosine could be provided simply by replacing the JSR SIN at line 1200 with a JSR COS. ■

Listing 2

THOR BLIMEY!

Plenty there is to be doing in *Erik the Viking*, a new text and graphics adventure, and like it very much I do, ya. It has been released by John Wiley (under its Mosaic Publishing imprint), and is available for the Commodore 64, BBC B and Spectrum micros.

The adventure is based on the popular children's book, *The Saga of Erik the Viking*, whose author is Monty Python star Terry Jones, and written by those wizards from High Wycombe, the Austin family, the Level 9 lords—so impressive stables all round.

Vikings rule OK

The game is set around 900 AD; the Vikings control most of England and rule the lands from Greenland to Sweden and south to the north of France. You may know that the Vikings just loved to pillage and plunder using their infamous raiding longships, but were you aware that their trading ships were called Knorrs? Now, not a lot of people know that.

The reason I feed you that educational morsel is because this adventure is said to pay meticulous attention to historic detail in both graphics and text. For instance, all the buildings shown are based on archaeological reconstructions and readings from the Viking sagas. If all this academic stuff is putting you off, don't let it. The fantasy element is there all right, so you'll enjoy playing while improving your education at the same time.

Norwegian good

Erik the Viking is played by your good self, and you begin up in the Norwegian mountains near your farm. You have just finished quietly dozing beneath the fir trees—and feel vaguely disquieted. You dreamt that an army of strange creatures swept down over the farm and dragged everybody away, including your wife. When you move down the hill and back to your farm, the dream turns out to be true—everyone has vanished. I don't know what the Viking equivalent of 'Cor blimey', is but that's exactly what Erik must feel like saying. So off you go, scouring the

Resident Dungeon master Bob Chapell dons his Viking cap and embarks on a rescue mission

surrounding area for clues. Well, this is an adventure, so what you're really searching for are objects that might assist you, and objects aplenty you will find—so much so that you'll be hard put to carry them all at once. There's a whetstone in the barn, some nails, a hammer and scales in the smithy and some trestle tables and assorted rushes near the Great Hall just for starters. They must be of some use, of course you take them.

One thing you learn pretty smartly is to examine or search

sword embellished with the words 'Copyright Level 9 Computing'! Cryptic, huh?

The Great Hall had a distinct pong of wolves about it, and there were some mysterious paw prints down by the river bank. I've heard of cat burglars—but lupine looters? Never. I soon found my first Knorr—if I hadn't had the graphics switched on, I might never have known what it was. The graphics, while quite attractive and quickly drawn, do not add a great deal to the game and can be turned off if you wish to

lure, see Viking Age, in your *Lords of Time* adventure?).

Gang jawfare

The gang that turn up to aid and abet provide some delicious giggles for seasoned adventurers. From time to time the gang tell you to hurry up—they even sit down and start to sing of gold! But don't worry, *Hobbit* fans, the singing is not a sign you're about to meet a sudden demise.

Circus tightrope

Big Top fans, are you constantly falling off the tightrope in Channel 8's *Circus*? Perhaps you have almost finished the

every object in sight—this proves most beneficial, as it either reveals a further object or some useful information. For example, searching one object revealed Blueblade to me. I thought, what on earth is Blueblade? Could it be some ancient Scandinavian safety razor? Last year's Danish Derby winner, perhaps?

A further examination told me it was neither—it was a

progress a little faster. The command words turns them off; PICTURE turns them back on again.

The ship turned out to be my own, the Golden Dragon, so no doubt I was destined to do some sailing. But how to get the thing down to the shore? A musical horn soon brought help (pause here for cockily erudite question to Level 9; surely this should have been a

adventure but can't work out how to get or use some petrol?

Tightrope problem:

1. TENY TEFAS ADNAR-
AEW TOOF LAIC EPSE
MOSD EENU OY.
2. NWOL CFOP LEHT SILN
ETEN TCER EOT.

Petrol problem:

1. ROTA RENE GMORF TINO
HPYS.
2. RACE VIRN NEHT KNAT
LLIF.

NIGEL SEARLE

Now it's the quantum leap for QL software and peripherals

Without doubt, the QL was the computer innovation of 1984. Launched to outstanding reviews, it soon gathered thousands of happy owners, and recognition from people like ICL, who have incorporated the QL and its Microdrives into the new One-Per-Desk.

The quickest glance at the QL's specification shows what the fuss was all about... 128K RAM, 32-bit processor architecture, 200K built-in mass storage, bundled software. They're features that would normally cost you three or four times as much!

But that's only half the story, because the QL is now the heart of a computer system, with a growing library of software...

As you'll see from these pages, 1985 is the year of the Quantum Leap for software and peripherals. Already there are no less than five QL languages together with special programs for software developers, a world-beating chess game... and much more on the way!

On the hardware side, there's a special QL monitor to make the most of that high resolution 512 x 256 pixel display. There

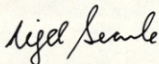

are memory expansion boards, Winchester disk drives, printers, and low-cost Microdrive cartridges.

In fact, there's so much going on, we'll be running these regular Newsletters just to keep you in touch!

If you already own a QL, the next few pages will give you a taste of the exciting year ahead.

And if you don't... take a look at what you're missing. It should be all the persuasion you need!

Now read on... the Quantum Leap into serious computing starts here.

Nigel Searle, Managing Director,
Sinclair Research Limited.

From sophisticated business packages to superb animated games... QL software makes the most of the computer's extraordinary specification.

New QL Software

Utilities, languages, games and business packages... with more on the way!

Two things are now certain about QL software. First, there's going to be plenty of it. And second, it's going to set completely new standards for microcomputers...

At the moment, there are well over 100 software programs in development. And the first

software releases, shown here, demonstrate how exceptional the best QL software will be.

The QL already has five languages, superb programs for software developers, a top quality accounting package and in QL Chess it has its first game.

QLUB: 10,000 members and growing!

QLUB is the special Users Bureau for Sinclair QL owners. There are now well over 10,000 QLUB members, and membership is growing all the time.

For their annual subscription of £35, QLUB members are enjoying a whole range of information and advisory services, exclusive offers and special discounts.

One of the most important QLUB benefits is the special news magazine, appearing six

times a year. The magazine provides a forum for QL owners to exchange views and keep in touch with all the latest developments.

Each issue is packed with updates on QL hardware and software, tips on applying the four QL Programs, and news of how other people are using the QL. QLUB members also receive a range of special discounts, with savings of at least 20% on selected software products.

Current special offers include:
QL Chess for £14.95
QL Toolkit for £19.95

QL Assembler for £31.95
QL Cash Trader for £54.95
Special subscription rates for Personal Computer News and QL User.

The multilingual Sinclair QL

BCPL – a forerunner of C, BCPL has been described as a systems programmer's delight. In the words of QL User, this compiler is a 'brilliant compromise between a high-level language and a low-level systems language'. Whilst not for beginners, this is an essential buy for anyone with a good knowledge of systems programming. Complete with manual.

Available from
Metacomco – £59.95.
Tel: 0272 428781.

LISP – already well-known for its artificial intelligence appli-

cations, LISP is a powerful and versatile language. This is a sophisticated implementation of LISP, by one of its leading exponents, Dr Arthur Norman. This package features full QL graphics, and a full manual is supplied.

Available from
Metacomco – £59.95.
Tel: 0272 428781.

Pascal – probably the most popular high-level language of all. Pascal is particularly well-suited to structured programming, sophisticated data manipulation and algorithmic problems. Pascal interpreter complete with 87-page manual.

Available from
Computer One – £39.95.
Tel: 0223 862616.

Forth – this 'new generation' language is proving both popular and easy to learn. The program provides a full implementation of the latest Forth 83 standard with graphics and sound extension.

Available from
Computer One – £29.95.
Tel: 0223 862616.

APL – the compact mathematics-based interpreted language designed for scientists and mathematicians.

APL keyword interpreter complete with manual.
Available from
MicroAPL – £99.95.
Tel: 01-622 0395.

Programmer's packs

QL Assembler – two programs operating in tandem. The first is a full-screen editor for creating and altering program files. The second, a Motorola-format compatible 68000 assembler which converts source files written in M68000 assembly language into machine code files which can run on the QL.

Both assembler and editor are written in machine code and can be multi-tasked with SuperBASIC, so you can switch

between editor, assembler and SuperBASIC instantly.
Written by GST Computer Systems – £39.95.*

QL Toolkit – a programmer's toolkit with over 70 programs, and extensions to SuperBASIC. Most are linked to SuperBASIC initially and can then be used from commands or from within a program. Enhancements include printer spooling (print a file while running a SuperBASIC program); improved file access (with full random input/output command); job control (allows management of multi-tasking programs including the ability to display, alter priorities, and delete jobs from the QL); and SuperBASIC screen editor.
Written by Q Jump – £24.95.*

World-beating chess!

QL Chess – fresh from its victory at the World Microcomputer Chess Championship. This program sets a completely new standard for games software.

There's a high resolution display, animated 3-D graphics, and 28 levels of play from novice to champion. Features include an openings book of nearly 4000 moves, HINT and TAKEBACK functions that help you learn from your mistakes, and the option to play a human opponent or the computer.
Written by Psion – £19.95.*

Software at work

QL Touch 'n' Go – a unique approach to learning touch-typing skills. The program is designed to give you mastery of the standard QWERTY keyboard in just 24 hours. With practice, you should soon reach 40 words per minute, with over 95% accuracy.

Written by Harcourt – £24.95.*

QL Cash Trader – a unique computerised book-keeping system for small businesses. The program provides a complete course in the principles of accountancy, and goes on to become an essential aid in the day-to-day running of a business. Complete with comprehensive manual.
Written by Accountancy Software of Torquay – £69.95.*

* This title is available from
Sinclair Research on
0276 686100, and selected
Sinclair stockists nationwide.

Psion trouble-shooting service

All QLUB members can obtain special assistance from Psion on using the QL Quill, Abacus, Archive and Easel programs supplied with the computer. Psion will normally answer any queries within 48 hours.

Free updates

QLUB members will also receive one free update of each of the four QL Programs – incorporating many new developments.

New QL Hardware

An industry is born

From the moment of its launch, the revolutionary QL attracted massive interest from all quarters.

In one area, the interest quickly turned to action, as high-tech hardware manufacturers realised the immense potential of the QL for vast expansion, for system development and for

widespread networking. Already the list of peripherals for the QL is very exciting – and lengthening by the day!

Here, we've covered many of the latest, most important developments.

As more appear, be sure to keep in touch with QL News!

The dedicated Sinclair Vision QL monitor

Once you see the incredible graphics capabilities of the QL you may decide an ordinary TV just can't do them justice.

If that's the case, a high-resolution monitor is needed. (And if you're creating presentation-quality charts, for example, it's quite essential.)

The new Vision QL monitor is specially designed for the computer by Kaga Electronics, with full support from Sinclair Research.

So it exploits the QL's maxi-

mum 512 x 256 pixel resolution to the full, with a pin-sharp 85 column display.

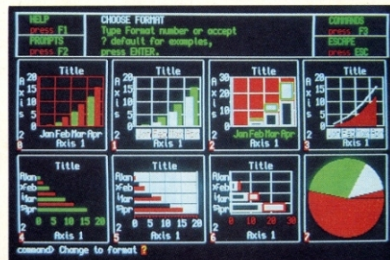

It's also specially styled to suit the QL – in looks, and in use. There's a 12" non-glare tube, and etched screen to diffuse reflections.

So the display is bright, sharp, much easier to look at... and invaluable for those late-night programming sessions!

And like the QL, the Vision monitor is designed with space in mind: it has a compact foot-

print of just 12½" by 15" – no more than a typical portable typewriter.

It's available from MBS Data Efficiency on 0442 60155 and selected Sinclair stockists.

The QL's superb graphics capabilities – as demonstrated by the Sinclair Vision QL monitor.

Microdrive cartridges. Another Sinclair First!

Microdrive cartridges are the QL's own unique storage media. Each stores up to 100K of information, on a cartridge no

bigger than a matchbox!
Access is within seconds. And in tests, Microdrive cartridges have made over 50,000 passes

without loss of data.

Over 500,000 cartridges are now being used throughout Britain. And QL Microdrives themselves are standard equipment on the new ICL One Per Desk.

Sinclair Microdrive cartridges – up to 100K of programs and data on a medium so compact you can pop it into your pocket.

Powerful hard-disk system

For the QL business user, the new Firefly QL Winchester disk will boost the QL's power in one huge leap.

Designed by Quest, it uses CP/M and offers all the benefits of Winchester technology: fast access, reliability, compact size and quiet operation.

With 75 Mb storage, the Quest Firefly is ideal for large databases such as stock or cus-

tomers lists. And at under £1200, it represents exceptional value for money.

The Firefly will be available very shortly from Quest on 04215 66488.

Winchester hard disk drives supplement your QL's built-in mass storage.

Interface options

The QL comes complete with two built-in RS-232C interfaces.

In addition, interfaces for Centronics printers are widely available from manufacturers such as CST, Mirade Systems and Sigma Research... with

prices from only £35.

And that's just the beginning. For attaching scientific and laboratory instruments to the QL, CST even offer an IEEE-488 interface, which can handle up to 16 connected devices simultaneously!

A Centronics interface slips discreetly into place.

Expansion boards for up to 4 times more memory!

Also from Quest, a simple and inexpensive way to expand the QL's RAM: with memory expansion boards.

These compact units connect to the standard QL expansion port, using the QL's internal power source or, for larger boards, an external power source.

The units range from 64K and 128K RAM boards to massively powerful 256K and 512K RAM boards, so there's something for every user.

Compact expansion boards.

Prices start at £117, and the 512K board is a very cost-effective investment at just £587.

With affordable memory like this, the QL is more than a match for any other micro under £2,000!

The spec behind the spectacle

CPU – Central Processing Unit
Fast, powerful Motorola 68008 chip. A second processor, an Intel 8049, controls the keyboard, generates the sound, and acts as an RS-232C receiver.

RAM

128K. Now expandable to 640K.

ROM

48K.

Operating system

Qdos – revolutionary single-user, multi-tasking, windowing operating system.

Storage

Twin built-in QL Microdrives. Up to 100K storage each – transfer rate, up to 15K per second.

Keyboard

Full moving 65-key QWERTY, five function keys, four cursor keys.

Language

Sinclair structured SuperBASIC

Application software

QL Quill – word processor
QL Abacus – spreadsheet
QL Easel – graphics
QL Archive – database

All four packages supplied with the QL.

Interfaces

Two serial RS-232C interfaces, Microdrive expansion port (up to 6 may be added), ROM cartridge port, local area network, 2 joystick ports, RGB monitor and TV output.

Text screen

Various modes – up to 85 columns by 25 rows on monitor. On TV, up to 60 columns.

Graphics resolution

512 x 256 pixels (four colour), 256 x 256 pixels (eight colour).

STAYING SHARP

The Sharp MZ5600 could knock Apple's Mac and Lisa computers off their perch. Trevor Jenkins puts this new micro on the operating table and gives it a thorough examination.

First announced at last October's London Business Equipment Show the Sharp MZ5600 range has since attracted a great deal of interest — so much so that not all the options were available for review. Sharp claims they're selling too fast.

Immodesty apart, Sharp has come up with an impressive micro, and made a sensible decision in not attempting to copy the IBM PC, although there are, of course, certain similarities. Both are based on the Intel 16-bit processors, the

IBM on the 8088 and the Sharp on the 8086, which means the 5600 has a 16-bit data bus compared with the eight bits of the IBM.

If the sort of work you have in mind is essentially 16-bit, the Sharp runs faster. There was a time when an 8-bit system used an 8-bit data bus, operated on 8-bit data and was easy to categorise. Now we have 16-bit systems with an 8-bit bus operating on 16-bit data, and are headed for the 32-bit system with a choice of 32-, 16- or 8-bit data buses.

First impressions

The 8086 processor may not have the best structure or instruction set available, but as it was among the first used in micros, it does have a large selection of software available for it.

Sharp has gone against the trend set by its competitors with 8086/8088-based systems in the size of memory provided as standard. Applications for the 8086 range have been memory hungry, and the manufacturers have exploited this by their entry-level systems not having quite enough memory to run the software package you need efficiently or effectively. Most of these systems start at 128K; Sharp, however, stands alone in starting you off with 256K. If you still need more memory there is an expansion board available.

In use

Program memory space is not affected by the video RAM (which is separate), although it does come out of the megabytes the 8086 is capable of addressing. The video RAM is normally 96K, but is expandable to 128K. The 96K is sufficient for monochrome display, but must be expanded if you want to exploit the colour capability.

The video RAM is accessed by both the processor and an NEC7220 graphics processor chip. The latter gives the MZ5600 series sensational graphics capability: it performs nearly all the graphics functions you might expect of a pricier microcomputer. Windowing, zoom, lines, circles and user definable characters are supported. Many sophisticated professional graphics devices are now appearing which use this chip. The demonstration system has some excellent examples of how to get the most out of this processor — multiple moving windows each with different picture elements, for instance.

Sharp has also included a programmable sound generator, supported by special statements in the Basic interpreter. The manufacturer scores over other systems here by also including a very necessary volume control, which is easy to find into the bargain.

I don't usually like such accessories but I was tempted to use it all the time with the review system.

While on the subject of noise there was excessive noise from the hard disk — not just when first switched on or when in use — but continuously. Sharp says production models will have some filtering to reduce this, but ask for a demonstration in a quiet place anyway.

Also whenever the floppy was accessed, this drive created a tremendous noise, reminiscent of an old manual typewriter. Is it safe to assume that solving the noise of the hard disk will also remedy the floppy drive problem?

The system is contained in a metal cabinet slightly smaller than an IBM PC's. Unlike many other systems, the metal box stops interference from the

electronics to surrounding equipment; it also protects the equipment in transit.

The review system came with one 600K floppy disk and a 10Mb hard disk all in the main cabinet. Apart from the keyboard and monitor, all the electronics are in this box.

On the front of the box is a socket for the keyboard, the optional mouse plugs into the keyboard. Also on the front are the volume control and the reset switch. The latter has been recessed into the metalwork, so pushing it accidentally is impossible. A nice feature is that the on/off switch is out of the way on the side of the cabinet far away from the reset switch, and any exterior connectors which are all on the back. The power switch is also recessed.

The sockets on the back are inset making them difficult to dislodge. There are two monitor sockets, one for black and white, the other for colour; this implies it may be possible to run the two together, but as the colour monitor was not available for review, I was not able to confirm that. There is also an additional socket for the keyboard. One serious criticism of these sockets is that both RS232 connectors are not the normal 25-way sockets, nor do they conform to the newer RS432 standards, so adding a printer will need some thought. Sharp's documentation tells you how to do this, but the plug is not the normal size.

A separate Centronics printer port is also on the back of the case. A socket to connect an external floppy disk is

Software

An impressive array of software was included for the review, the mainstay being CP/M-86. Sharp has made very useful additions to the utility programs and overcome some of the problems inherent in CP/M-86. Several celebrated packages came on hard disk, but without

GWBasic will be available early in 1985). So, a number of control structures are not present for the programmer. For example, there is no WHILE or REPEAT statement — only FOR/NEXT loops are allowed. A little worrying are the inconsistencies between this version and any other. The most irritating is that the PRINT statement only works on the printer. To print items on the monitor the DISP (display) statement comes into play. Then there are the strange forms of the single-line IF/THEN/ELSE statement. Lastly, the interpreter distinguishes between the cases of letters.

The capabilities of the 7220 graphics chip are covered by many statements in this Basic. Control of each separate window can be established with one statement; scrolling of any window can also be done in one command, in either up, down, left or right. The 7220's characters display can use user defined symbols, in an easier way than the BBC Micro does, the functionality is the same but more direct.

Presentation of output can be enhanced using a very powerful PRINT USING statement which allows printer control character sequences to be included in the output. On the monitor it is possible to put up a grid of various sized boxes with a Table command, which will impress anyone who uses the Sharp for producing management reports.

A number of statements are dedicated to the function keys to make full control easy. One of these is used for debugging and correcting erroneous programs.

Programming language purists may be upset to discover that some mathematical functions don't use the usual function syntax. However, there are

Plenty of function and editing keys are to be found on the keyboard.

present but this option was also unavailable for review (and ominously is not mentioned in the price list).

I would like to have seen some power supply sockets on the back, which would have added to the superiority of the system by enabling the monitor and printer to be powered without needing additional mains plugs and wires.

The quality of the monochrome monitor supplied matched that of the system. A swivel stand allows the position to be adjusted. The keyboard is modelled on the IBM PC, but has a better feel and a slightly different layout. It is thinner than IBM's, with small feet that are either up or down, rather than variable.

manuals. *DBase II*, *SuperCalc* and *WordStar* were supplied and the list of other software ready for the MZ5600 shows that Sharp has got its act together on this score too, unlike many others. MSDOS and CP/M-86 will be supplied free of charge with the machine.

Sharp has not forgotten the 8-bit customers, and the Basic interpreter accepts programs written for those earlier machines. Two conversion programs are provided to read an 8-bit system disk and convert the programs to the new format. This Basic is excellent, despite a few idiosyncracies.

What you should remember is that this is not Microsoft Basic (although

HARDWARE PRO-TEST: SHARP MZ5600

redeeming features: a full set of floating point functions, and the ability to switch between degrees and radians for the sine and cosine functions.

More upsetting to everyone may be the licence agreement between Digital Research Japan and the buyer. The terms and conditions are ludicrous. 'Digital Research Japan make no warranty of any kind' runs one, and 'the entire risk as to the quality or performance is with the purchaser' warns another. So, if CP/M-86 does not work on

panying explanations are obscure. There is also a user's manual which includes concise details of the hardware, though data sheets for the various devices would also have been welcome. A system integrator would need them, as would anyone trying to use the sound generator or the 7220 from a non-Basic program. The Basic interpreter does provide access to them, but not everyone wants to use Basic, even on this good.

The Basic interpreter documentation is among the best for this language. The

we're kept awake at night searching for the answer.

The only niggling problem with the Basic manual is that it's not in alphabetical order, but it does at least have an index of keywords.

Two quick reference cards are included in the package: first, a DR pocket manual which includes the Sharp extensions. This covers most of the contents of the DR manuals, but in very meagre detail — a deficiency best demonstrated by the error message section which explains self-explanatory errors. The section on BDOS function calls is much too cramped — it needs much more space (perhaps given up to those error messages); however, it is useful and can save time.

Basic also has a quick reference card, organised alphabetically; unfortunately, some of the notation is not explained (such as the use of input/output unit numbers). It has small examples with parallel explanations in addition to the

arrival, that's just tough. Come off it, Digital Research, this won't curry any favour with your customers. In fact, I would like to refuse to sign my agreement or even to purchase CP/M-86 — perhaps that's why it comes free. DR may be trying to protect its investment, but there's protection and there's ripping people off.

Documentation

The usual 16-bit documentation comes in an IBM-style binder, with a box to store it in.

The manual's presentation is good, and the usefulness of the documents ranges from barely adequate to almost excellent.

Since only CP/M-86 manuals were supplied my comments are limited to those books. In my experience, it is likely that what is said about DR's offerings will also be true of Microsoft's MSDOS manuals. For the latter, I was provided with some photocopied pages of an MSDOS manual, relating to the Sharp and my comments below concerning its CP/M-86 documents would seem to be true of this manual too.

Software suppliers tend to think only in terms of quantity rather than quality of documentation, and that's true here. The impression that both Digital Research and Microsoft give is that they do not understand their audience.

The CP/M-86 documentation (a programmer, system and user guide) is as issued by DR with the necessary addendum and errata sheets. For those who have already seen these manuals don't despair, Sharp has put great effort into reproducing them. The contrast of the copies is very high overcoming the faintness of the originals.

Sharp has added a separate manual to these three to cover its additions to CP/M. Unlike DR's, this is typeset, and the examples are clearly laid out and well chosen, though some of the accom-

Volume control (top) is an unusual feature on the micro and the Sharp MZ5600 has plenty of scope for expansion (bottom).

panying introductory section which leaves teaching the language to the many books already available; what it does cover are essential details of the implementation for those who have used another version. The manual is well laid out, with each Basic keyword on a separate page, along with the formal definition of the statement and examples of each possible format included. There are notes in explanation of the function.

What lifts this manual above the rest is that in addition to the explanations, there are helpful tips on the use of the statement with good examples, even if they are a bit laboured. There are also footnotes to answer those questions most of us have never wanted to ask until

format of each keyword.

Verdict

If you want some compatibility with an IBM but are not too concerned exactly how much, or you want to be happy in your use of a machine, relying on the documentation to tell you what you want to know again, then the Sharp MZ5600 is your machine.

When DR's GEM package becomes available for the MZ5600, it is going to put up a good fight with Apple's Mac and Lisa machines — that NEC chip does some startlingly good graphics.

All in all, this is probably one of the best 8086-based machines at this level of the market today and deserves a lot more attention. █

SPECIFICATIONS

System	Sharp MZ5600 range, comprising cpu, 256K memory, single double-sided, double-density floppy drive, mono monitor, price £1595; the MZ5641 (as MZ5631, but with second floppy drive), price £1995; and the MZ5645 (as MZ5631, but with integral 10Mb hard disk) price £3495. (These prices include CP/M-86 and MSDOS as standard and one year on-site maintenance.)
Peripherals	Colour monitor, Mouse (£95) 256K memory expansion (£299), 96K video memory expansion (£230) and an 8087 Numeric processor available (price unknown).
Manufacturer	Sharp Electronics (UK), 061-205 2333

Your standard BBC Micro
will have this many RAMs.

Upgrade your BBC Micro and you'll have this

That's right, a massive 256 Kilobytes of Random Access Memory, plus hardware and disc compatibility with the U.K.'s number one personal computer, the IBM[®]PC.

Just think of the potential for your Model B. The opportunity to explore the vast range of IBM[®]PC compatible programming aids, languages and business software packages, which are already established as 'State of the Art' and are destined for a growth pattern previously unknown in the Industry.

And they'll be IBM PC

To take full advantage of this high calibre software support the Torch Graduate incorporates twin 360K floppy disc drives and two IBM PC compatible expansion slots, thus making available options such as local area networking, ideal for business and educational applications or auto-dial/auto-answer comms modems, linking up with viewdata and electronic mail services such as Prestel and Telecom Gold.

As an added bonus, we even start you on your way with the PSION XCHANGE integrated software package comprising, word processing, financial planning, graphics and database management programs, specifically developed for the colour version IBM[®]PC.

BBC Model B owners, this is your day of reckoning!

Torch Computers, dedicated to the BBC Micro in more ways than one.

with a Torch Graduate many RAMs.

compatible.

Technical Specification • 8088 16-bit CPU (5MHz) • 256K RAM • MSTM.DOS operating system customised to IBM PC compatibility • Twin double sided, 5 1/4" floppy disc drives (each 360K formatted) • 2 IBM PC compatible expansion slots • Free PSION XCHANGE software (Abacus, Easel, Archive, Quill) • Software compatibility allows Lotus 1-2-3 and all popular IBM/PC business programs to run without modification, subject to constraints of BBC keyboard and display • Acorn Disc interface is not required • Keyboard, text and graphics by BBC Model B Micro.

For the name of your local Torch Graduate dealer complete the reader enquiry card or ring (0223) 841000.

ARM WRESTLING

Ralph Bancroft and Kenn Garroch engage in a trial of robotic strength and control with the Colne Armdroid and the budget Fischertechnik system.

Micro controlled robotics is a growing area of interest for many schools and for home enthusiasts. The major drawback is the cost of the robots and often the lack of software to drive them.

Fortunately, things are starting to change and a number of 'build your own' robots are becoming available at fairly reasonable prices.

Colne Robotics has been a leading manufacturer of low cost robotics equipment and a robot arm is one of its latest products. It is available either in kit form or already assembled. I took the coward's option and reviewed a sample of the latter. It turns out that this was probably a good move as we were later informed that kit assembly is pretty difficult.

Setting up

The Colne comes with an interface, operating software, a power supply and some manuals. Connecting everything up was simply a matter of plugging one lead of the interface into the robot, the other into the user port on the BBC.

The power supply comes in a weighty cast aluminium box which gives the appearance of being able to provide enough power to lift anything, although it does get very hot after an hour or so of use. With the robot powered up, the control software centre loaded, from tape, into the BBC.

Programming the Colne follows the seemingly universal process of moving the arm to a position in a sequence and then instructing the computer to remember that movement. This is continued for the complete movement cycle. Because the Colne is capable of movement through a number of axes, there are some additional commands not available on something like the Fischertechnik.

The arm is mounted on a rotating base and has joints at the elbow and wrist. The latter swivels and rotates and supports the three-fingered hand, which can open and close. All this is strung together with a veritable knot of cord and pulleys. All the cords return to a pulley set contained in the base. Each pulley has a lever on it for manual adjustment.

In use

The upshot of all this is that the program needs to be able to control the whole lot. This is done by assigning two keys to each movement (back and forth) with a number of subsidiary commands for turning the stepper motors on and off, and setting up the points which need to be remembered.

Colne Robotic's Armdroid: needs to be taken by the hand and shown what to do.

To get the robot to do anything, you have to move it to a suitable home position, defined as such with the home key. Keyboard controls are then used to move the arm to the next point. This can involve any mixture of wrist, elbow and arm movements which the computer not only seems to be able to tack together, but smoothens when it plays them back. Any number of attempts can be made to get the movement right.

I eventually got things working so that the arm would pick up the phone and, unfortunately, drop it again. The grip is not terribly good for holding telephones, perhaps because it's a little on the small side. Smaller objects, present far less of a problem. Using a large felt tip pen, it is possible to get the robot to draw lines, admittedly rather curved ones.

The accuracy is not great and a centimetre or so is lost every time the manoeuvre is repeated.

Real problems occur when attempts are made to move the arm to its extreme positions. Things get so strained that the cords tend to jump off the pulleys. Putting these back on is fiddly, to say the least, and tends to pull everything out of line. Getting going again means turning off the motors and adjusting pulleys, mainly in the wrist, until everything is realigned.

Verdict

The Colne robot arm is a good quality kit and certainly looks the part of a robot arm. If you intend building it remember that it could be a little difficult. Buying it ready-built gets around all this fuss, and the only manual labour involved will be occasionally putting the pulleys back in line.

Playing with robots is great fun. The hardest bit is thinking of some use for it besides lifting things up and putting them down again.

If you can think of some reason to justify the cost then the Colne is rather more than just a toy. ▀

Product Colne Armdroid 1 for BBC micro
Price £569.23 plus 3% PP (ready assembled), £534 plus 3% PP (kit form)
Availability Colne Robotics 01-8928197

For those with a lower budget, the Fischertechnik robot kit might be a more attractive option — particularly as you can use it to construct no less than six different computer controlled models.

The Fischertechnik computing kit is aimed only at those interested in tinkering around with the basic principles of robotics. By no stretch of the imagination could it be considered a precision technical instrument.

You are given the pieces to construct a 'teach-in' robot that can learn simple movements and repeat them, a plotter, a model that plays the Tower of Hanoi game, a solar cell tracking device, a graphics tablet and a sorting system.

The basic kit should be available through some leading toy shops but comes with two significant disadvantages: the manuals are in German, and there are no details on how to connect it to the leading makes of home micro used in the UK.

The package deal offered by Micro Robotics Systems is probably a better option. For £112 you get the basic kit plus interface and software to hook it up to a BBC micro.

together (and cheated on the wiring — see picture) it was obvious that the whole exercise was designed as an obstacle course.

If the construction details in the Fischertechnik manual were scant, the information in the Micro Robotics Systems manual was simply atrocious. All it consisted of were a couple of photocopied sheets that left more than a little to the imagination.

The Fischertechnik robot: a simple robot arm at a budget price.

points as it goes through its paces. The object of the exercise is to teach the arm to move to one position, pick up a metal disk and drop it in another position.

Changing modes allows you to store the sequence of moves and then tell the arm to repeat it once or several times over.

The lack of precision soon became obvious as the arm had a tendency to overshoot or undershoot the expected positions. As a result it often went into self-destruct mode by crashing into parts of the model where it quite clearly could not go.

Verdict

The great advantage of the Fischertechnik computer kit is price. You could pay hundreds of pounds for a simple robot arm and not get to grips with half the concepts covered by Fischertechnik's six models.

Setting up

The kit itself comes in a box complete with all the parts to make the six different models. But the instructions on how to make them are primitive to say the least.

Exploded diagrams in the manual illustrate the different stages of construction and you then have guess how all the pieces fit together — not as easy as it sounds to a first-time user.

Having put the model together you then stumble across a final diagram showing the assembled model and its associated wiring. The problem is that there is no mention in the previous diagrams about the wiring and you discover that to achieve the neat result in the photograph you have to take the model apart and start all over again.

The model chosen to test drive was the teach-in robot. Having put the model

It took a couple of hours' experimentation to get the interfacing correct.

The next problem, a fault in the interface box, caused one of the model's electric motors to remain continually. The fault was cured only by opening up the box and having a good poke around until the bad connection was identified.

In use

The movements of the robot arm are completely under software control. The software is provided on cassette and allows you to rotate the arm, make it go up and operate a magnet at the tip of the arm.

In instruction mode you make it move and, using the Beeb's keyboard, mark

Unfortunately, you might find that the real challenge is assembling the models and then figuring out how to wire them into your micro.

The blame for this sorry state of affairs must rest with Micro Robotics Systems whose poor documentation and less than reliable interface and software (it crashed on more than one occasion), turns what should be a pleasurable voyage of exploration into a nightmare journey of frustration. ❑

White Knight 12 sets new standards in computer chess games.

White Knight Mk 12, for the BBC Model B, is Martin Bryant's attempt to improve on his excellent Mk 11 version, which incidentally, won the home computer section in the 1983 European Micro-computer Championships.

On the face of it, Mk 12 is both more powerful and includes enough extra features to justify a new version. This review was carried out on a preproduction version, complete with Bryant's own manual, though the finished program should now be in the shops.

Bryant has tested Mk 12 against a variety of other programs, including the Mk 11 version (which the Mk 12 beat 13-3).

The list is impressive, but Bryant doesn't include any mention of how Mk 12 performs against his own excellent program, Collosus, for the Commodore 64. In many ways, Mk 12 looks and feels like a direct translation of Collosus — a later and stronger program than the Mk 11 — though Bryant reckons that in the development from Collosus to Mk 12, he has achieved substantial improvements in the program's algorithms.

But the real question is which is the best program, and from what I have seen of this one, coupled with Bryant's results, Mk 12 is undoubtedly the best available for BBC users.

Like Collosus, Mk 12 has a vast

Borisenko vs Nahimovskia, 1969.

number of playing levels. Although there are only four playing modes, Mode four allows the user to specify an average elapsed time per move in any combination of hours, minutes and seconds. The program defaults to ten seconds a move when you first select Mode four, and it provides an enjoyable game at that level.

Openings

I wasn't particularly impressed with the strength or quality of the openings book,

TWICE KNIGHTLY

although the limited RAM on the BBC may be the excuse for this. But as Grandmaster John Nunn's annotations demonstrate, Mk 12's tactical capabilities are good enough to give casual players a thrashing at the higher serious levels.

One improvement over the earlier version is that Mk 12 knows about 'underpromoting' — the technical term to describe the deliberate choice to promote a pawn which has reached the eighth rank to something other than a Queen.

This is not the sort of facility you'll often care about, since it is natural to choose the Queen. But there are rare instances in a game when checkmate can be elegantly and instantly achieved by selecting a Knight instead of a Queen, and there is also the fact that a chess program which can't underpromote can't really be said to play all the legal moves.

One new feature that most users will not like is Bryant's inclusion of a routine to prevent the program being copied from cassette to disk. Mk 11 was not a protected program, and it could be saved to disk.

It is understandable for a programmer to want to prevent illicit copying of his software, but the advantages of disk over cassette are so great that to be forced to hang about for five minutes waiting for a cassette tape to load is extremely irritating. BBC Software has plans, apparently, for a disk-based version, but that will not be available for a while.

Other additional features include the ability to save any position or game to tape (though if the saving process is flawed for any reason, the Beeb loses its memory of the game — so you need to write down the game score before saving), user defined board colours, more information on the screen, and the fact that the program now continues to analyse the position on the opponent's turn to move.

The screen display is good, and instant replay facilities are available at any point in the game. The speed of the replay is user driven, since you return to the beginning of the game by pressing Control N for new game, then proceed move by move by pressing F (forward). Alternatively, you can step back for a maximum of 128 full moves.

One interesting feature is Bryant's way of handling user input. Wherever the program requires a number from the

user (ie for colour changes, time settings, or playing levels) the program displays a default number which is decreased or increased by pressing the appropriate cursor arrow key.

Moves on the board are made by either using the cursor keys to position the cursor over the chosen piece and entering, then indicating the des-

White to play, mate in four moves.

tionation square and entering, or (with the Beeb in lower case mode) by entering the appropriate algebraic notation.

Combinations of the two methods are also possible (ie when you type b the cursor shoots to the b rank — if you key in B instead, it moves the board position and game score back a move).

Verdict

White Knight Mk 12 is weaker than the present generation of dedicated chess computers, like the Super Constellation. But it is strong enough to beat most casual players and good enough to give those outside of the professionals an enjoyable game.

Tony Harrington

PCN extends its congratulations to Grandmaster John Nunn for his recent outstanding performance in the 88-nation chess Olympics at Salonika. In the Olympic's 57 year history, Nunn's 10 points from a total of 11 games is the best individual score since the great Alekhine won 9 out of 9 in 1930. Nunn's score helped the UK team to its first ever silver medal, four points behind the Russians.

Pro's view

How good is White Knight Mk 12? John Nunn played it off against the Mk 11 version to find out.

White is to play in this position from a game Borisenko-Nahimovskia played in the USSR in 1969. Borisenko found a

beautiful forced mate in four by 1 Qh5xh7+1 Kh8xh7 2 g5-g6+ Kh7-h8 3 Rg1-g5! (threat 4 Rg5-h5 mate) f6xg5 4 h4xg5 mate.

I fed the position into the Mk 12 and at first it favoured 1 g5-g6, a weak move allowing Black to block the kingside by 1...h7-h6, but after 2 hours 38 minutes it found 1 Qh5xh7+, and played the rest of the mating line without difficulty. It is rather a long time, but ask yourself whether or not you would have found the winning line.

The second test was more impressive. Most chess programs have a problem-solving mode, designed to solve the puzzles which are often found in newspaper columns where White has to mate in a fixed number of moves.

This is much faster than the normal mode, because the machine is only looking for a mate and can disregard any other type of advantage. In problem-solving mode the Mk 12 solved the first diagram in just under three minutes, a 50-fold increase in speed.

Finally, a problem composed by A Werle in 1945. How does White (to play) force mate in four moves? The Mk 11 erroneously concluded that 1 e7-e8=Q does the trick, because it didn't consider the cunning defence 1...d2-d1=N+! 2 Kf2-g3 (to keep Black's King bottled up in the corner) Nd1-e3. Then 3 Qe8xe3 is only stalemate, while otherwise White is unable to force mate in two more moves.

On the other hand, eight seconds was enough for the Mk 12 to find the correct solution 1 e7-e8=R! The threat is 2 Re8-h8 mate, so Black still has to play 1...d2-d1=N+ 2 Kf2-g3 Nd1-e3 (or else White mates by Re8-e1), but now White can simply continue 3 Re8xe3 Kh1-g1 4 Re3-e1 mate. The point is that with the rook instead of the Queen on e3, the square g1 is not covered and Black isn't stalemated. **John Nunn**

Lucky breaks

As everyone knows, chess is a game of pure skill. Luck simply does not enter into it. Or does it?

I remember playing a game in the final round of the Middlesex under 18 championship, more than two decades ago, when a win would have secured the county title for me. After pondering an intricate position for many minutes, I failed to notice that I could give checkmate, and instead played a different move which only drew. Had my opponent played that phase of the game better than I had done, or was he lucky?

Luck can also play a decisive effect in a computer game. Perhaps the most dramatic example of a lucky break in computer chess was seen in this year's World Microcomputer Championships in Glasgow.

Psion Chess, in a hopelessly lost position, won the game on time. Why? The opposing machine, Fidelity's Elegance, was running with EPROMS that had been programmed shortly before the

tournament. Improvements — a one byte change — to the endgame code had been telephoned to the Fidelity factory in Miami.

Somehow the two hex letters needed for the change had been received over the telephone line back to front, with the result that the EPROMS contained one wrong instruction. The program crashed frequently, once the endgame had been reached. It was these repeated crashes, in a winning position, that cost Fidelity the game, and the tournament. Was Psion Chess lucky?

The position here arose in the 1984 North American Championships in San Francisco. White was the Chaos program which has long been one of the contenders for top honours in the event. Black was Phoenix, an up and coming Canadian program. Chaos had earlier made an unsound sacrifice, and was now faced with an ending in which Black had an extra piece.

A respectable human player would have resigned White's position by now, but computer programs are not yet 'respectable' or respectful.

The game continued:

37 ... Kb6xc7?

Black should first push the a-pawn to a safe square, and only then go after the e7 pawn. That way Black would eventually be able to create a passed a-pawn (after capturing on a3).

38 Kf5-g6 Bg7-f8

39 Bc3xa5+!

The correct pawn. If White captured on e5, Black would hang on to the a-pawn and win.

39 ... Kc7-c6

40 Ba5-b4!

A good swindling try.

40 ... Bf8xb4??

Black knows that when you are materially ahead you should try to trade off pieces. What Phoenix fails to appreciate is the potential strength of Whites King side pawns.

In the initial position, prior to Blacks 37th move, I made a \$5 bet with one of the Chaos programmers that his program would not lose. Now I offered to bet him \$10 that his program would win the

game! Being a piece down, he accepted my bet.

41 a3xb4 Nc8-e7+

42 Kg6xb6 g5-g4

43 Kh6-g5!

Naturally not 43 f3xg4?? e5-e4, and e-pawn soon becomes a Queen.

43 ... g4xf3

44 g2xf3 Kc6-b5??

The wrong way. Black's King is needed near the centre and k-side. The

Black to move, move 37.

knight should be used to stop the b-pawn, and Black could then draw.

Now Phoenix can see that 45... Ne7-cb 4b h2-h4, gives White an unstoppable h-pawn, but the text move serves him no better in the long run.

45 Kg5-f6 Ne7-d5+

46 Kf8xe5 Ndxb4

47 h2-h4 Nb4-d3+

48 Ke5-f5 Nd3-c5

49 f3-f4 Kb5-c6

50 h4-h5 Nc5-d7

51 h5-h6 Nd7-f8

52 Kf5-f6 Kc6-d7

53 Kf6-f7 Nf8-h7

54 Kf7-g7 Kd7-e7

55 Kg7xh7 Ke7-f7

56 f4-f5 Kf7-f6

57 Kh7-g8 Resigns

Who was lucky? I won the bet, but that is skill — knowing the limitations of computer programs. Chaos won the game, but that is because it played the final stage better than Phoenix. Or should we say that because Phoenix threw away a winning position, Black was unlucky? In which case White must have been lucky. **David Levy**

COMMODORE 64

GANDALF

The plot in *Gandalf* is fairly simple: you play the Gandalf of the title, and your castle is under attack from lizard-men who will enter and steal your apprentice, your task is to get him back and amass points by killing the reptilians.

In the first screen Gandalf stands on battlements above the courtyard in the foreground. To the left is his apprentice, stirring a magic potion. A forest stretches away into the distance, and it's from here that the lizard men approach. The joystick controls Gandalf's spell, pressing fire blows up a lizard with a neat little nuclear mushroom.

Casting spells drains Gandalf's strength (his colour changes to indicate this), but energy can be gained by moving Gandalf up to one of the towers at left or right: there's a magic

star in the sky which zaps Gandalf back to life in a jiffy, but only when it's free of clouds.

The lizard men move in from the wings and look like dinosaurs. Once they reach mid-screen they turn and march toward the portcullis. Each one

you blast turns to a gold coin which shimmers on the forest floor. After a time the portcullis rises and you should let a lizard man in to take the apprentice. Then you can follow the beast out of the castle to screen two.

Things are pretty hairy outside. The reptiles have dragon-like tendencies and will give you a dose of flame if you let them get too close. The plan here is to avoid them, blasting as many as possible, collect the gold coins and rescue your apprentice. From time to time a gold ostrich flies past and nicks one of the coins. To rescue your apprentice you must set a trap in the path of the abductor, but you can't defend yourself once a trap has been set.

Once you've vanquished enough lizards the gold you've

collected jingles into your coffers and the action speeds up, but lose your three apprentices and you're doomed.

Gandalf is a curious game, there's not an awful lot to it and it would be quite easy to master fairly quickly. It has a healthy proportion of that rare quality — playability, partly due to the neat graphics and partly the fairly original plot. It deserves a look, but what a pity there are only two screens — and where's the 'realistic sound' advertised on the inlay? All in all, fair fun in a limited format. **Bryan Skinner**

THE HORSE LORD

There's a trend in the computer games business to base all sorts of games on books of the same name. This offering from Century is either loosely drawn from the novel, or the book is one of the dullest fantasy novels to hit the streets in recent times.

The game is well packaged and the cassette includes numerous protection devices. The most ingenious is a rewrite of the cassette operating system to produce a loading sequence, completely devoid of the comforting clicks of the cassette

relay and on-screen block counter. There is also something supposed to prevent copying. But it's a shame the program isn't worth all this effort.

You take the part of the Horse Lord, a latter-day knight bent on the delivery of a message to a distant castle. In your path are footsoldiers, moats and — for variety guest what? — footsoldiers and moats together. The full path is depicted in the first screen and shows your route as a sort of square spiral to the castle in the centre.

Your old oss shuffles along to the first obstacle, which you combat on a second screen. If it's a moat, you have to jump it, if it's a soldier you have to cut him

up with your trusty blade or pierce him with a deadly arrow. *The Horse Lord* is depicted as a large helmet above a horse's head with a sword apparently

protruding from its mouth. The moat is a horizontal strip of blue across the screen, and jumping it means taking a run and pressing Return at the appropriate point. If you get it

wrong it's back to the start.

The soldiers, which you meet one at a time, are also helmets wielding swords. By getting close and wapping the Return key, you can usually inflict enough damage to beat them.

The whole procedure is timed by a small band slowly decreasing across the bottom of the screen. It runs out much too fast and provides the main exit from the game. The closing image is that of a grotesque head with blood gushing from it — not for the squeemish. **Simon Williams**

LEDGEMAN

Ledgeman seems at first sight to be a rather elementary platform game. In fact it's the most varied and compulsive platform game I've ever played on the BBC micro.

The loading screen scrolls the brief instructions and the controls (not redefinable) across a teletext display, and once loaded offers controls for music and sound effects and the selection of one of three levels of difficulty. The music is a suitably manic rendition of a part

of the William Tell overture, and should be turned off if you're playing late at night.

The first screen shows a

number of ledges and ladders, interspersed with large, multi-coloured Hydra and pulsating rectangles. Avoid the Hydra and take all the rectangles to

move on. The second instalment has lots of ledges, but nothing to stop you grabbing the goodies — until the clock, which limits the time on each screen, reaches quarter past. Then fireballs drop from the roof, destroying platform sections and you if you get in the way. If you don't move fast on this screen you'll be stranded.

The third screen has a number of wheels rolling about the place, *Donkey Kong* style. These have to be avoided or jumped over. On screen four you have to board moving ledges like passing trains.

Screen five involves the fall-

ing fireballs once again and a number of conveyors as well. Screen six has a spiral of ledges and ladders which seem simple until an explosion in the centre sends all kinds of debris bouncing about the place. The last screen is almost entirely conveyors with Hydra. After seven screens you return to the beginning and the skill level is increased. An excellent game with a lot of variety. **Simon Williams**

SPECTRUM

VAMPIRE KILLER

One shouldn't expect too much from pocket-money priced games — but as a cheap game, *Vampire Killer* has its good points.

You must try to ascend to the twelfth floor of a building to where Dracula is asleep behind a door. The only way you can progress between floors is by using the lifts, but unfortunately these have gone a little

haywire: you might find yourself going down when you had hoped to go up.

The screen shows a split-level, side-on view of two floors with your little man in position. One floor looks exactly like another with its two green doors and one pink lift shaft. There may be a spider or bat blocking your way, but they can be shot if you have a bullet.

Any door may be opened and entered, the screen changing to show you the room. There may be one or more objects in the

room — hammers, garlic, stakes and crucifixes, or bullets. It may also harbour a shock

(such as a skeleton or spider) — you can only survive a few of these scares. If the room turns

out to be an air shaft you'll tumble all the way back down to level one.

Because all the floors and rooms are very similar, the game gets rather boring after a few plays. It's all based on a random set-up, and is not entirely bug-free. **Bob Chappell**

GAMEPLAY

BBC

AIRLIFT

Ever since the advent of the helicopter version of *Scramble* there seems to have been an unspoken competition to design the most plausible chopper sprites for an arcade game. *Airlift* must get marks for best yet on the Beeb. It's well-proportioned and has a convincingly animated rotor as well as a rotating tail-fan. There's also a nifty little autogyro that 007 would be proud of. That said, there isn't much else to recommend this game.

The plot revolves around the

rescue of hostages from a series of bombed houses and their transport to the safety of a Red Cross hostel.

In a rather defeatist manner,

the sleeve notes encourage you to wait until each house is destroyed by passing tanks before you try rescuing the

hostages. In fact you get few points if you destroy the tanks before they shoot.

When you land to pick up the hostages, well animated minute figures, you are (of course) fair game for any marauding tank. Once in the air, however, you're comparatively safe and as long as you can make a reasonably soft landing back at the hostel your hostages obligingly disembark.

Your next sortie will be a bit further away, but since your fuel is unlimited, time is the only difference.

After about six rescues an autogyro appears. This will blow you out of the sky, given

the chance. It's not too hard to avoid, but a Killer Satellite adds its weight to the argument in the later stages.

Sadly, there just isn't enough going on to make *Airlift* as addictive as it ought to be. Control of the helicopter is hit-and-miss, and much of your time is spent positioning the chopper to land in the right place. This may all be part of the fun for some, but for me it adds to the frustration. **Simon Williams**

AFRICAN SAFARI

African Safari, according to the cassette inlay, 'abolishes the distinction between arcade and adventure.' I was under the impression that this had been done and not by software such as this, which is essentially an adventure with graphics, along the lines of (but nowhere near as good as) Melbourne House's *Zim Sala Bim*.

Here you're Dr Livingstone, seeking the long lost Kenyan Diamond, the character being in the centre of a scrolling graphics display. By a curious choice of commands you need a joystick to move him east and west, but have to type GO NORTH

OR GO SOUTH for those directions.

Above the display is a description of your surroundings, and LOOK will have the Doctor gazing around and reporting on what he can see. Beneath is stated the directions in which you can move, the WHAT NOW? prompt, and a clock (you have only an hour to complete the adventure, with no SAVE or PAUSE facility).

Initially you can only head east and west, and east finds a peanut plant with peanuts attached. GET PEANUTS? I've got a bad back,' reports the Doctor (some Doctor!), a reply that becomes infuriatingly common, as at the next location where there's a fire and a tin can.

Further along are two monk-

eyes, one strong and one weak, the weak one having the advantage of a gun. You must choose which of the monkeys to take.

The eastern limit of the first screen is set by a snake sitting

on a paddle, and when you've walked to the western limit you can go SOUTH to the Zambesi River, and another set of east-west locations for your character to walk maddeningly slowly along. Here you find a boat, so

now you're up to the Zambesi without a paddle. How to deal with the snake? Keep exploring, and use your monkey.

More difficult is how to deal with the strange responses. Type LOOK near the boat and you're told: 'There is nothing special. I can see a boat here.' GET BOAT. 'I can't see a boat.'

African Safari is ruined further by being so slow to play. If this abolishes the distinction between adventure and arcade, then give me one or the other every time. **Mike Gerrard**

AMSTRAD

MANIC MINER

The game which really started the plethora of platform games *Manic Miner* is available for the Spectrum, 64, BBC, MSX, and now the Amstrad.

It all starts with miner Willy at the bottom of a very deep mine (some 20 screens deep). How he got there is neither explained nor relevant, but with your aid he will do his best to escape by collecting the flashing treasures, and entering a portal which will take him to the next level.

Naturally there are a number of different obstacles, both stationary and mobile, to negotiate. Contact with these is fatal, and Willy only has three lives. Each screen is given a title, and these, together with a number of the characters, form

a series of 'in' jokes among members of the arcade programming fraternity. These are beginning to fade with time, but the graphics are still witty and everything moves very smoothly.

The game remains none too easy either, and I've still to get past the fifth screen consistently. The sound effects are average, but at least you can turn the incessant 'Hall of the Mountain King' off. The demonstration mode offers tantalising glimpses of all 20 screens, but these are too short to allow you to develop a useful strategy.

I'm surprised the program-

mers who converted *Manic Miner* didn't do more with the Amstrad's graphic screens. The game runs in Mode 1, so only four colours are available, but surely more detail could have been put into each character. Perhaps it's sacrilegious to want changes to the original masterpiece, but it seems a pity not to make the most of the graphics potential of the host machine. **Simon Williams**

COMMODORE 64

KONG STRIKES BACK

Of hairy is back again, still with a damsel in distress in tow. This time Kong has sought refuge in a fun fair.

The first screen shows a Roller Coaster at the top of which Kong has perched his yelling captive. What you have to do is guide your man around the track until the Pinnacle is reached. Kong releases four cars down the coaster — if one

hits you, you go bouncing around the screen, finally coming to rest back at the start.

There are two ways of dealing with the runaway cars. You can release a bomb in their path, but as this only blows up the lead car, you might not have time to fire another before the next car arrives. A simpler method is to shun up one of several ladders, and let the cars pass over or below you.

Once at the top, you have to move right past the damsel to make Kong reappear otherwise nothing will happen and you

won't move on to the next of the four screens.

Screen two is very similar to

the first. It has a different track layout, and there are some bouncing balls, but it's still the

same mixture as before. The remaining screens promise waltzers, horses, and springs.

The background music is great and the animation is impressively smooth. The drawback is that the first two screens are too similar, and the fact that there's only four screens means that the challenge is very limited. **Bob Chappell**

HEAVENS ABOVE

Astronomy software can present the subject of star-gazing in a unique way. Colin Cohen loads up and looks to the stars.

One of the good things about micros is that they make some tasks easier, and these three programs go one better. Instead of standing out in the cold night air, you can now go star-gazing from the comfort of your armchair. No longer do you need a torch to read your astronomical handbook, and you can view the night sky from anywhere on Earth and even travel back in time.

Several astronomy programs have been released recently, here we look at three for the BBC: *Star Gazer*, *Astronomy* and *Star Seeker*.

Features

I began using *Star Gazer*, then came across *Astronomy* and realised the two should have been integrated. The first only deals with the stars, the second with planets and seasons. Then *Mirrorsoft* released *Star Seeker* which has all the features of the other two.

But, before you rush off to buy it there are some differences in the way the programs approach the subject which are worth bearing in mind. For example, *Star Seeker* and *Star Gazer* suffer from slow screen updates if you change the time or your viewpoint. They're so slow I forgot what the old screen looked like before the new one had been drawn.

Documentation

Perhaps it's the subject matter, but for the first time in a review of this kind I can say that all the documentation is very good—the text is clear and well-written. *Star Seeker* comes with screen dumps and while *Star Gazer's* manual is execrably printed there is a useful colour chart and diagrams explaining the Celestial Poles. All three programs are available on cassette or disk.

In use

Star Gazer deals with the 31 brightest constellations, the criterion for selection is simply if they can be seen with the unaided eye on a clear night. You can call up a plot of the night sky in any

direction, then move that window on the sky around the star map.

Pressing 'd' draws in the lines linking the stars in each constellation and displays their names and those of the 61 brightest stars. The Study Suites allow you to pick a constellation, or to guess which constellation is being shown. A short explanatory text can be produced under each image.

Astronomy is a slightly misleading title because it only deals with the solar system, but it complements *Star Gazer* well and makes extensive use of the Beeb's colour graphics.

The phases of the moon are demonstrated with an orbiting screen and there's an inset to show what the moon

Astronomy — calculating the sun's angles.

looks like at any time. In Quiz Mode you can stop the orbit and guess what the moon looks like at that stage.

Partial and total eclipses can be generated, and the package carries dire warnings about looking at the Sun. Most complex are the seasons, and there's a good try at showing the effect of the Earth's tilted axis on the seasons from Auckland to Zanzibar, but due to screen limitations it's not to scale.

The planetary movements are given in another section. You can select from one to all nine planets, but for this you really will need a colour monitor to do the program justice. There are no aliens, but the problems of landing a rocket on any of the planets and using more than a dozen keys to cope with the different effects of gravity and atmosphere on each planet are not easy to master. I found it both difficult and slow and was soon lost in hyper-space. Note that the program will not run on the early OS 0.1 BBC machines, though these can be updated for £5 to £10.

Star Seeker covers 53 constellations, 308 stars, the nine planets, the sun and the moon, but makes little use of colour. There's a section on Halley's comet on one of its 76-year round trips to the third stone from the sun. You can vary the scale of the display, and indeed unless you do I fear Earth will be wiped out by

Star Seeker — defining star positions.

the comet in 1986.

As well as plotting sky views (the information overlays are less complete than those of *Star Gazer*), you can calculate such things as times of sunrise or the moon's phase on any date. Some displays are text-only, information that would perhaps be more at home in the manual.

Star Seeker includes a driver for Epson or compatible printers which you can use for screen dumps at many points in the program. BBC Publications say that there isn't room in *Astronomy* for a printer-driver, but the manual describes how a screen can be saved to disk and then dumped to a printer.

Verdict

If you want to use these programs to teach astronomy, you'll have to bear in mind what the BBC's blurb says, they'll all need 'an active partnership between parent and child or teacher and pupil'.

All three programs are up against the 32K limitations of the BBC Micro, though *Star Seeker* is also available for the 48K Spectrum and Commodore 64. But for once the subject matter is such that the subject can be shown and explained in a way quite impossible for any book.

They are all programs to which you can return again and again, for education or for the sheer pleasure of looking at the stars without clouds, buildings, light-glare or driving rain. For my money, *Astronomy* has the edge.

THE QL SuperBasic Utilities

These 100% micro multi-tasking utilities run as independent jobs within DOS and are controlled separately from BASIC. Displays are real time and versions are supplied for monitor and TV displays (Custom screen formats on request).

- TRACER** — The current, executing BASIC line number.
POINTER — The actual statement in use on the line.
SIZER — Dynamic size of statement and variable stack.
DATER — Current Date line and statement.

Run with on/drive or disk and with any memory size. Low, recoverable memory usage. Good control of BASIC programs. These are possibly the last word in Utilities for the BASIC Programmer. You can identify run-time errors quickly and an on error box all pointers are listed for inspection. Save yourself hours of listing, break-pointing and frustration.

SBUS (all 4), on a cartridge — £14.95 inc VAT/P&P.
 Also in the DataManagement QL series and more at the time!

- | | |
|---|--------|
| MACRUP — fast, multi-tasking backup. | 15.50 |
| ZORDER — what's in my RAM | 14.50 |
| INTERM — at last a terminal program. | £12.50 |

Check/P.O. to DataManagement: 12, Larch Way, Hady, York YO3 8BU or Telephone 0904 79351 for further details.

QUIT

It was business as usual at the *Which Computer?* Show last week. Oric wasn't there, Sinclair found that the show was just too early for it to show off the matching accessories for the QL, and Commodore displayed its new PC but wouldn't say what was in it.

Accorn, on the verge of delivering its first real business systems, also stayed away and for home micro fans the only remaining point of interest was the occasional MSX machine that sat shyly on the stands of a couple of Japanese manufacturers.

But there's many a slip... one of the joys of these events is that companies have to make an effort to stand out from the crowd. This tempts them into the kind of folly that under normal circumstances they'd run a mile from.

There was Tandy, which succeeded in distracting attention from its Model 1000, 4P, 2000 and the rest almost completely by arranging to have an acrobat (Gina, pictured above) perform from a hoop above its stand. Gina was hoisted towards the rafters by earth-bound assistants whose ropes effectively closed off areas of the Tandy stand.

Commodore left its elephant

at home and Microvitec has apparently found a home for its famous tiger cubs, but with a touch of humour the company demonstrated a caged monitor with a growling tiger on the screen. The advantage of this is that the monitor doesn't need regular attention with water and red meat.

Brother hit problems of a different kind. To launch its TC600 printer/comms terminal Brother thought it would be a smart idea to take the London-based press up to the show by train while simultaneously communicating with another terminal at the National Exhibition Centre in Birmingham.

When first approached British Rail was keen on the idea,

and swore it could be done, but after four months BR changed its mind. The comms facilities available were sent only, and Brother was therefore reduced to booking a room at Birmingham International to give the demo once the train had arrived.

Still, it wasn't all bad news. The Brother Express was well patronised, to the extent that there wasn't a single free seat in the restaurant car. Unfortunately, whoever had done the counting had forgotten to include the Brother people, who were forced to stand for the duration of the journey.

FALL GUYS — Subtly isn't the first thing you'd think of in connection with US advertising, but this Commodore promotion beats about the bush even less than most. It's how Commodore is advertising its new C128 in the US, and as you can see it gets right to the point. No messing about with elephants over there.

SYNTAX ERRORS

In issue 94 the first line of the first part of the Bruce saga was short of a letter or two. It should read: FOR W = 1 TO 10

Some owners of issue 3 Spectrums may be having trouble with the listing of The Castle in issue 94. The problem lies with the IN values in lines 1100-1200.

In 1100 change 254 to 190. In 1110 change 253 to 189, and in 1200 change 254 to 190.

Sandwiched between Arendarvon Castle and Hawthorn ATC on our Software Preview page last week was Technician Ted, which we wrongly ascribed to New Generation. In fact Ted is a creation of Hewson Consultants — our apologies to him for casting doubt on his parentage.

NEXT WEEK

Aladdin's Cave

We present an original game from Tony Crowther, the author of Potty Pigeon, Suicide Express and many others. We'll publish a complete machine-code listing over the next few weeks.

Spectrum palette

Part one of a screen-art routine to put some colour back into your Spectrum's cheeks.

Two Brothers

Hard copy comparisons in the Pro-Test of two versatile units from the Japanese company with the family name.

QL turntable

We give a spin to CST's disk drives just released for the Sinclair QL — is this the end for Microdrive?

PAL2000
by Mollusc

I've been chatting up the whitehouse computer...

Discover anything vital??

It's raining in Washington!

PCN DATELINES

REFLECT ON THIS

A word processor designed with the typist in mind and a financial spread sheet developed to help the busy manager. These two powerful stand alone programs can only be surpassed by one thing . . . **THEIR OWN TOTAL INTEGRATION.**

Word Result and Calc Result have been created with *true* integration – giving you the freedom to use each program either separately or together. In today's office, where work overlap and machine overload can become a big problem, Calc Result and Word Result can help you take the strain.

WORD RESULT features:—

- Eight European languages with true hyphenation
- Mail-merge
- The text on the screen as it will appear on paper (left, right or centre justified)
- Easy to use commands and help screens
- Automatic saving of your document whenever you stop typing

CALC RESULT features:—

- 64 X 254 X 32 pages
- Automatic locking of formulas
- Full colour down to cell level
- Individual column widths
- Pie and bar charts, saved and printed
- Consolidate all your work with ease

These are just some of the features available in each program . . . and then when you put them together . . . !

Why not send the coupon in TODAY and find out what else these programs have to offer?
