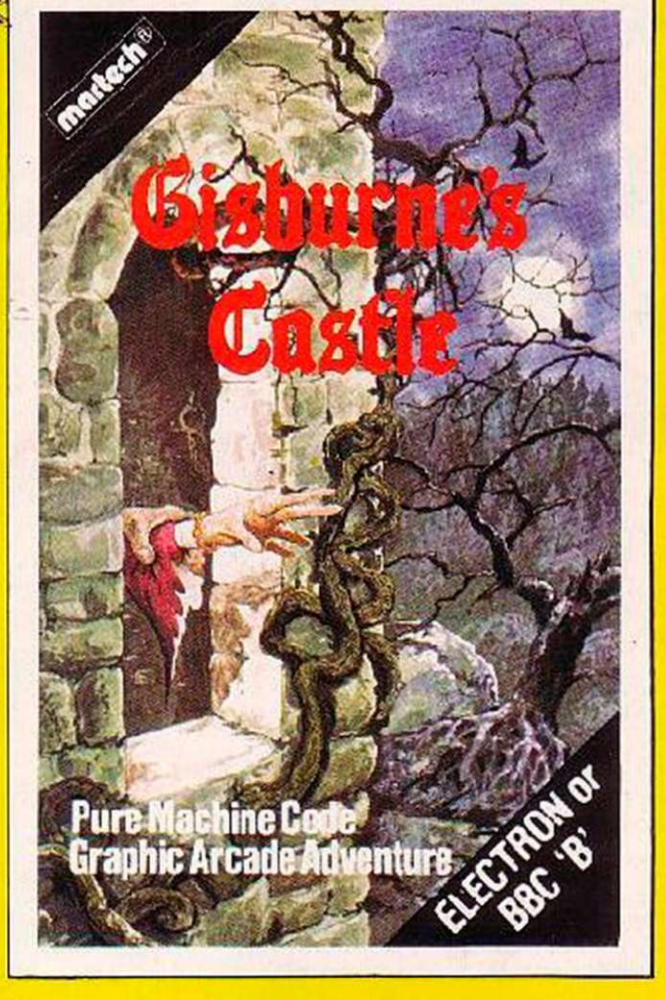
Pandora by Harry Bates. Reproduced by kind permission of The Tate Gallery, London

SPECTRUM 48K **£5.95**

Once upon a time, Zeus had one of his master craftsmen fashion a mortal of perfect beauty — the first woman — he called her Pandora — meaning "all gifts". Zeus presented her with a golden casket, but bade her promise never to open it, but Pandora grew curious and one day she lifted the lid. With a rush and a cry, out came all the ills that now beset man; disease and sorrow, hate, jealousy, theft, lies and many more. Pandora rushed to close the lid, but all of its contents had escaped, save one, "Hope". Since that ill-fated day when Pandora infested the world with terrible woes and suffering, Hope has always remained a comfort to this troubled world — until now! Someone has stolen Hope, and famine, disease and violence have taken over the world.

Enter the magnificent and dangerous world of Ancient Greek Legend in this amazing hi-res graphic adventure. One-eyed giant Cyclops and the many headed Hydra are but a few of the incredible creatures you will meet as you sail treacherous seas and cross dangerous landscapes in your struggle to return Hope to its guardians on Mount Olympus, the home of the Gods.

NEW



BBC 'B' or ACORN ELECTRON **£7.95**

Guy of Gisburne, treacherous henchman of the Sheriff of Nottingham, has captured the lovely Maic Marion. In his heavily defended castle — he holds her as bait!

Become Robin of Loxley, the hooded man, on a mission of rescue and vengeance.

Written in 100% machine code and making full use of the sound, colour and hi-res capabilities of each computer, Gisburne's Castle blends the action of the arcade with the challenge of an adventure, into one outstanding game.

Features:

- ✱Hundreds of different graphic locations
- ✱20 different animated and intelligent characters
- ✱15 different objects to be found and used
- ✱Joystick option and user definable keys

Available from most leading retailers or directly by mail order

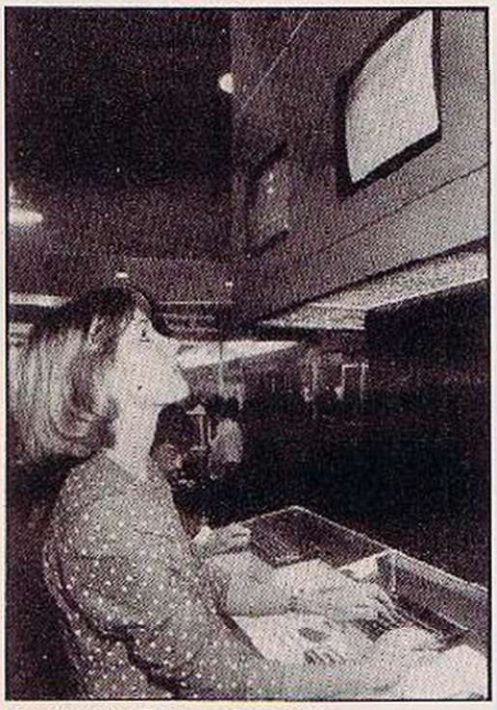
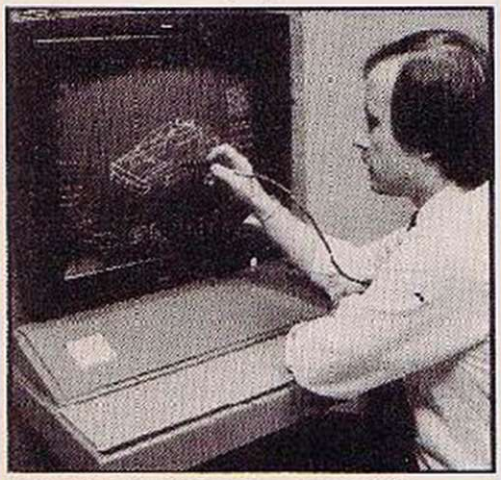
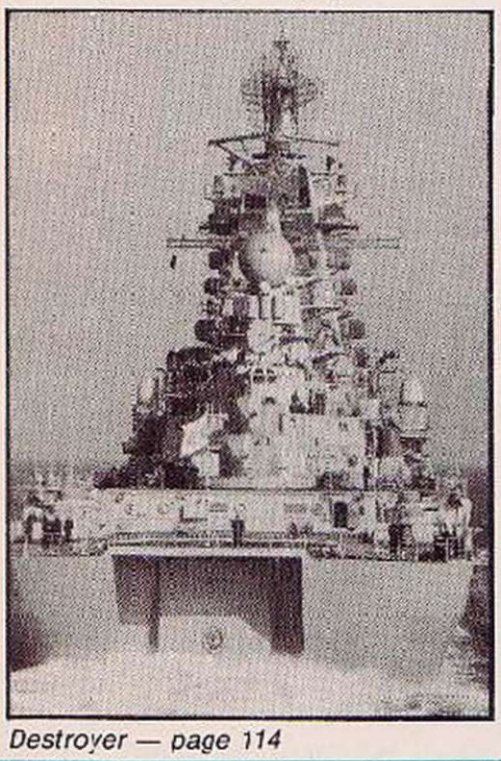
JULY 1984



Computer Fair — page 35



Breaking on thrcugh — page 66



Destroyer — page 114

32 YOUR LETTERS: Unhelpful dealers; making your Dragon go faster; non-violent games; MSX — too little, too late?

35 NEWS: Computer Fair; double trouble — Camputers and Dragondata; gold for the Game Lords; two from Commodore.

39 FIRST BYTES: Starting with machine code; choosing a printer.

43 COMPUTER CLUB: Paul Bond plays away at Fulham.

45 SOFTWARE SHORTLIST: New commercial releases.

49 QUEST CORNER: Hugo North guides you to your goal.

52 QL REVIEW: Kathleen Peel tries out the latest QL (with the new ROM) but is still not happy, especially with the speed of the word processing package.

56 SPECTRUM SOFTWARE: Survey of the latest games.

59 BBC ROMS: Richard Lambley looks at graphics facilities available in ROM.

66 BREAKING ON THROUGH: How micros are getting into motoring.

69 WATSON'S WORDS: John Watson's reactions to racing games.

70 SECOND-HAND MICROS: John Dawson guides you through the second-hand micro jungle.

79 DANGEROUS GARDENS: Jason Charlesworth discovers something nasty at the bottom of his garden.

82 VIC JET MAN: Stop the deadly Whizzers in David Hodgett's game for the unexpanded Vic-20.

84 WRIGGLY: Be kind to worms. Help Wally find his way in Keith Suddick's game for nature lovers and Commodore owners.

87 BIPODS: Destroy the Martian pods before they destroy you in D E Thorpe's game for the ZX-81.

90 SNAKY: M North squirms around the screen in this machine code game for the Dragon

97 WORD GAME: It's not Scrabble but N. Pearce's game is fun if you have a 16K Atari computer.

100 THE BEANSTALK: Recover the three treasures from the giant in this Spectrum game by Colin Carruthers and Ronald Sellar.

104 GRID WORZ: Simon Phipps and his BBC micro take on more than even three Shreaded Wheat can handle.

109 VIC DRAW: A high resolution drawing routine for the Vic-20 from Arnie Blomberg.

114 DESTROYER: In this game for the Oric Miles Dunlop takes to sea in an attempt to sink the fleet.

117 BBC SPRITES: Bobby Rao follows up last month's sprites routine with an article which tells you how to use them.

123 HEAD-UP DISPLAY: Alan Lee's ZX Panel program for the ZX-81 helps you to enter and debug machine code programs.

127 CBM-64 EXTENDED BASIC: Alex Sturt explains how to extend CBM-64 Basic with routines which do the Pokes for you.

133 SPECTRUM EXTENDED BASIC: A method of adding Basic commands without using Interface I is describd by Robert Newman.

141 DRAGON FORTH: A program which allows the Forth language to be used on the Dragon from Brian Watson.

145 COMPETITION: Results of May's Coleco Adam Competition.

147 RESPONSE FRAME: Tim Hartnell answers your problems.

149 SOFTWARE FILE: Programs for most home micros.

DOWN, DOWN AND DOWN AGAIN

The deeper you dive, the deeper the danger. Through cavern after cavern to find the pearls and the treasure. (It's different every game!) Sharks, octopuses and jellyfish are everywhere; and look out for your oxygen level! Staggering graphics, fantastic colour – a true arcade adventure.

Another great quality game from the house which brought you

"Harrier Attack!" and "Jungle Trouble."

Data to your Commodore and music to your ears

THE ROTRONICS DR2301
AUDIO/DATA CASSETTE RECORDER

£34-95
(p+p £2·00)

• Why should you need two cassette recorders just because you are a Commodore user?
• The ROTRONICS DR2301 has all the facilities you would expect of a quality audio recorder and also works perfectly with the VIC 20 and CBM 64 computers without any fiddly separate boxes or adaptors. Simply connect the DR2301 directly with your Commodore computer via the lead supplied and you are ready to start. The built-in interface circuitry ensures that SAVEing and LOADing is completely reliable – even when using commercially produced software. The DR2301 also allows the computer to sense when the PLAY key has been depressed.
• Additional features are auto-stop, tape counter, inbuilt microphone and foldaway carrying handle. The DR2301 is also compatible with the ZX81, Spectrum and many other popular home computers.
• The DR2301 will take its power from the computer (Commodore only), mains adaptor (supplied) or internal batteries. Each unit carries a full 12 month guarantee.
• All this at a price which is a lot less than you would pay for a dedicated data recorder – just £34.95 (p & p £2.00). Send your order form to (no stamp required):

SMT, FREEPOST, Greens Norton, Towcester, Northants. NN12 8BR.

ORDER FORM
Please send _____ Rotronics audio/data recorder(s) at £36.95 (inc p & p) each. All prices inclusive of VAT. Please make cheques payable to SMT. Allow 28 days for delivery.

BETA BASIC 1.8
ENHANCED BASIC FOR SPECTRUM 48K
FOR GRAPHICS – STRUCTURED PROGRAMMING – DATA HANDLING

Release 1.8 is more powerful than ever! We don't have space to do this program justice – if you can't believe the rest, send us a large S.A.E. for further information.

Features: Commands are single-entry keywords in graphics mode. Syntax is checked on entry. Fully compatible with Spectrum Basic. Microdrive compatible. Comprehensive manual.
NOTE: Release 1.0 is still available for 16/48K Spectrum at £11.00.

ALTER screen colours (general or specific)
AUTO line numbering
BREAK out of code loops
CLOCK digital clock
CURSOR CONTROL CODES allow screen to be treated as complex shapes
DEF KEY user-definable keys
DELETE a block of lines
DO-LOOP structure
DPOKE double poke
EDIT specified line
ELSE (used with IF...THEN)
EXIT (leave DO-LOOP)
FILL enclosed area with specified ink or paper
GET wait for keypress
JOIN two program lines
KEYIN a string
KEYWORDS new keywords on/off
LIST#3,AT line TO line
LISTD (used with GOTO, GOSUB)
ON ERROR trap errors (with LINE, STAT and ERR$)
PLOT a string (may contain cursor control codes)
POKE a string
POP Basic's stack
PROC, DEF PROC, END PROC (for named procedures)
RENUM versatile renumber
ROLL all or part of screen in any direction by specified number of pixels, with or without attributes
SCROLL like ROLL, but without wrap round
SUM arrays (very fast)
SPLIT program lines
TRACE program execution
UNTIL used with DO or LOOP
USING used with PRINT
WHILE used with DO or LOOP
XOC, YOD move "LOT sight"
XRG, YRG change PLOT scale

FUNCTIONS

AND (bit-by-bit)
BINC decimal to binary
CHAR$ number to 2 characters
COSE ast cosine
DEC hexadecimal to decimal
DPEEK double PEEK
FILLED filled area
HEX$ decimal to hexadecimal
INSTRING string search
MEM free memory
MEMORY$ all of memory as a string
MOD modulus
NUMBER 2 characters to number
OR (bit-by-bit)
RNDM fast RND
SCRN$ recognises user graphics
SINE fast sine
STRING$ repeats strings
TIME$ current time
USING$ formats numbers
XOR (bit-by-bit)

Only £11.00 inclusive! (Upgrade price for Release 1.0 owners is £4.00. This includes a 12-page supplement to your manual. Please quote date of purchase. If you did not purchase from us, state supplier and return original cassette.)

Please send me:
Beta Basic, Release 1.8. Payment of £11.00 is enclosed.
(or £11.50 for foreign orders). Cheques payable to BETASOFT.

I don't believe it! Please send me full details of Beta Basic 1.8. I enclose a stamped addressed envelope.

Firm up your S/ware with an

EPROM PROGRAMMER

AT LAST! for the Spectrum user. Put your programs, utilities, Assemblers into EPROMs for instant load from the unique ROM-SP.

ROM-SP NEW **for Spectrum**
Ingenious unit for Spectrum, with 2×28 pin sockets and a Reset button allows up to 16K of Basic or M/C program to RUN or LOAD instantly from EPROMS. Cabled connector and full extendix card. NOTE: Does not disable Sinclair ROM. **£29.95**

PROMER-SP NEW **for Spectrum**
A brand new Spectrum programmer for 2764/128. Zero insertion force socket & software on tape. **£29.95**

PROMER 81.S NEW **for Spectrum**
The very popular PROMER 81 for the ZX81 has been adapted to the Spectrum and the price kept low. **£22.95**

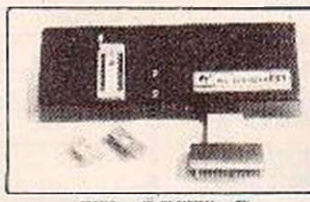
ROM-81 **for ZX81**
Provides two 24 pin sockets for up to 8K of EPROM memory in the 8-16K area. Can use 2516/32 or 2716/32 **£14.95**

PROMER-81 **for ZX81**
At last! A low cost reliable programmer for 2516/32, 2716/32 EPROMS. Requires 4×PP3 batteries **£19.95**

DHOBI 1 **UV ERASER**
Compact. Mains powered. Safe. Fully cased. Up to 3 EPROMS **£18.95**

DHOBI 2 With automatic timer **£22.95**

BLOPROM-81
A uniquely sophisticated EPROM PROGRAMMER
In use at various labs incl. Sinclair



Eprom programmer for the 2516, 27XX single supply families, yes, even the 27128 from Intel. Check, Read, Program + Verify all or part of Eprom.
So immensely user friendly you'll hardly need the manual. Designed for the beginner but includes a single key entry route for the professional. Supplied as firmware, the m/c driver routine alone is worth more than the price of BLOPROM-81. No personality Cards, or other additions, just a ZX81. Several inbuilt safety features. On-board Vpp generation. 28pin ZIF socket. Cabled connector and extender plug. ABS case. **£79.95**

Dream-81
Full 64K Rampack with link options to disable 0-8-16K. Plus a 28 pin EPROM socket for 2716, 2732/2764 and even the latest 27128 from Intel. Fast/slow Eprom option, professionally built and tested. In an ABS case with an LED indicator **£59.95**

MEMIC-81
A 4K CMOS RAM and lithium battery unit. Easy SAVEing, 10yr storage and instart retrieval of programs. Resides in 8-12K or 12-16K of ZX81. **£29.95**

CRAMIC-81
Ingenious hardware/software allows this 16K CMOS RAM with lithium battery to CO-exist in same memory area as ordinary RAM. ZX81 can multitask on two completely independent programs. **£79.95**

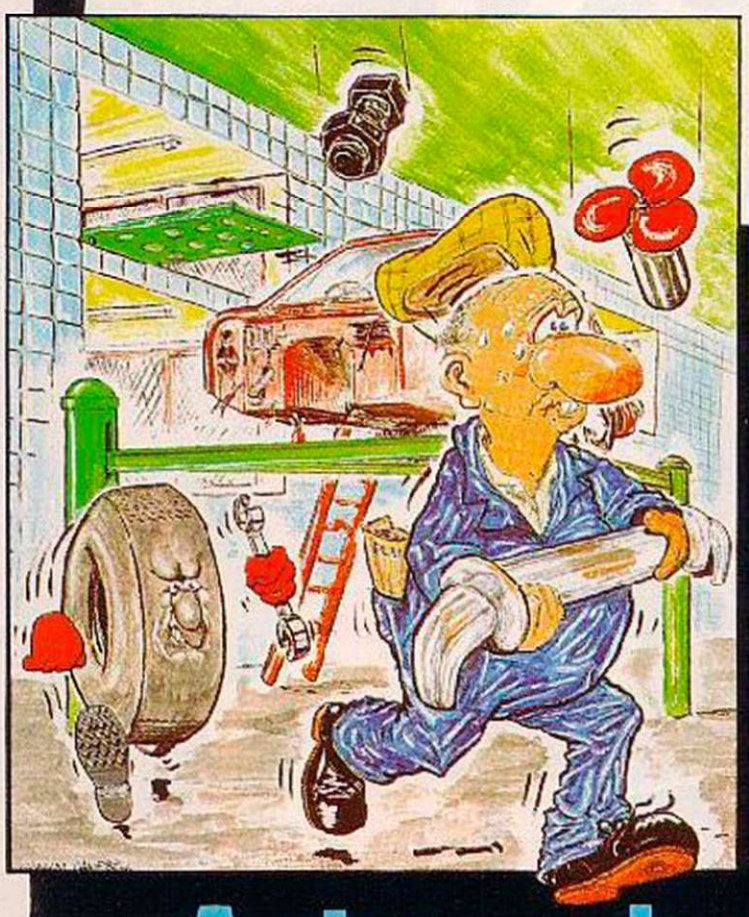
This week – it's
Wally Week!



Wally Week is here – starring in Mikro-Gen's great new game

Automania

Meet Wally Week – the incomparably incompetent hero of Automania. Help him climb the ladders and jump the gaps whilst rebuilding ten cars – and avoiding a hailstorm of nuts and bolts, an avalanche of tyres, and a Tidy Robot which clears everything up – including the car poor Wally is rebuilding. And if you can do it, start again at a harder level – it soon gets very difficult. . . .

Ten screens ★ Superb graphics ★ Great animation!
It's all on Automania, starring Wally Week

Automania ONLY £6.95 For 48K Spectrum

Just part of Mikro-Gen's great range – look out for Laserwarp (and see if you can win £100 for the month's highest score), Genesis II, Paradroids, Drakmaze, and lots more at Co-op, Boots, W H Smiths, Menzies and other leading retailers, or order direct (plus 40p post & packing) from:

ANI

Graphics — This program enables you to paint and draw on the screen by controlling a simulated pencil and brush which can be manoeuvred either by keyboard or joystick. This utility can be used to create and edit background pictures stored in half the normal memory space by use of innovative data compression techniques. Together with its automated drawing techniques; circle, line and centring routines; background colour options, and tape load and save choices; this makes the creation of an artistic wonder possible for ALL USERS.

Animation — The animation utility allows easy manipulation of sprite data pictures, several sprite designs, and a multitude of musical compositions and everyday sounds. This facility is a compilation of all the facets of the graphic and sound utilities.

GAS-KIT 64

Sound — This section of the package turns your Commodore 64 into an intelligent synthesiser on which you can choose to play solo or duet on a piano, organ, harpsicord, xylophone, harp, bagpipe, harmonica, violin, banjo and flute with variable tempo and pitch. The sound routine includes replay, store, fetch, load and append options, so making the composition of superb audio effects an extremely simple task.

£14.95 INC. VAT.

3 New Utilities from ANIROG in One Package GAS-KIT-64

Develop the artistic and musical capabilities of your Commodore 64 with an astounding extension of its Basic by 23 commands, allowing you to use the monitor as a canvas to generate high resolution pictures and the keyboard to compose music for your own programs/entertainment. This completely interactive package enables you to create masterpieces quickly thus shortening and simplifying program writing. For instance, create a work of art to use as a backcloth, add your sprites, then compose a musical piece for background music together with a few everyday sounds, bring them all together, and you've produced an animated cartoon to music in a short time, by use of a simple extended Basic Program. GAS-KIT-64 even allows incomplete tunes and designs to be stored and finished later, and to help you on your way, educational and demonstration programs and help instructions are included together with full menus and pictureprams. When all is complete you can store your productions on your own Basic programs.

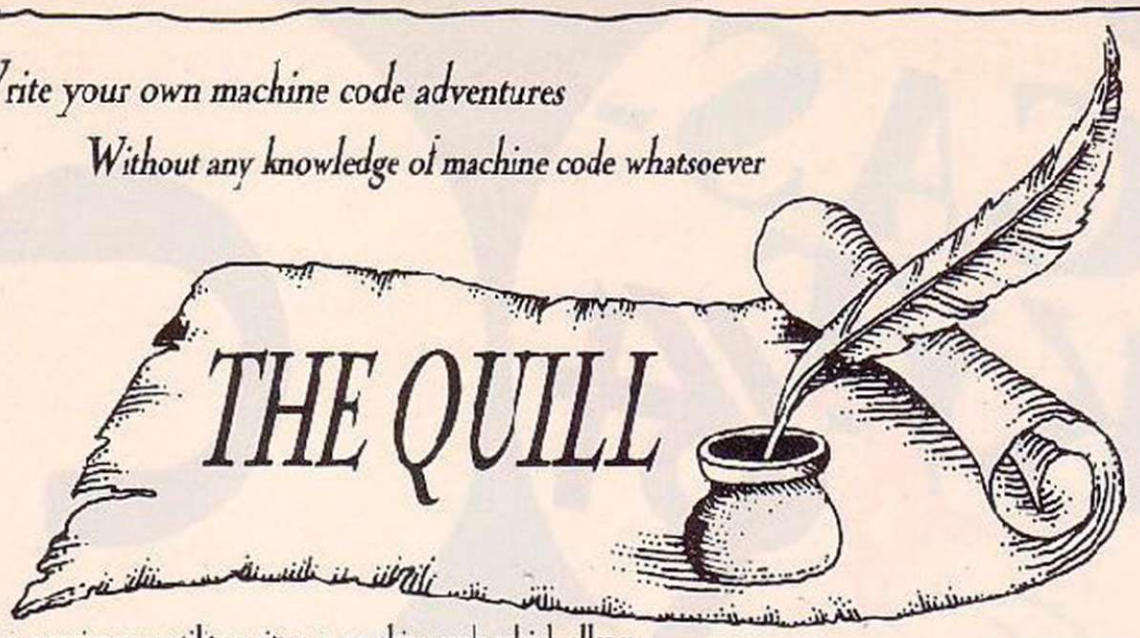
Write your own machine code adventures

Without any knowledge of machine code whatsoever



THE QUILL

THE QUILL is a major new utility written in machine code which allows even the novice programmer to produce high-speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever.

Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so *THE QUILL* will allow you to produce a copy of your adventure which will run independently of the main *QUILL* editor, so that you may give copies away to your friends.

THE QUILL is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures.

The new Electron from Acorn. Ask any child at school why it's worth £199.

Most British children have one thing in common with the new Electron microcomputer: they speak the same language.

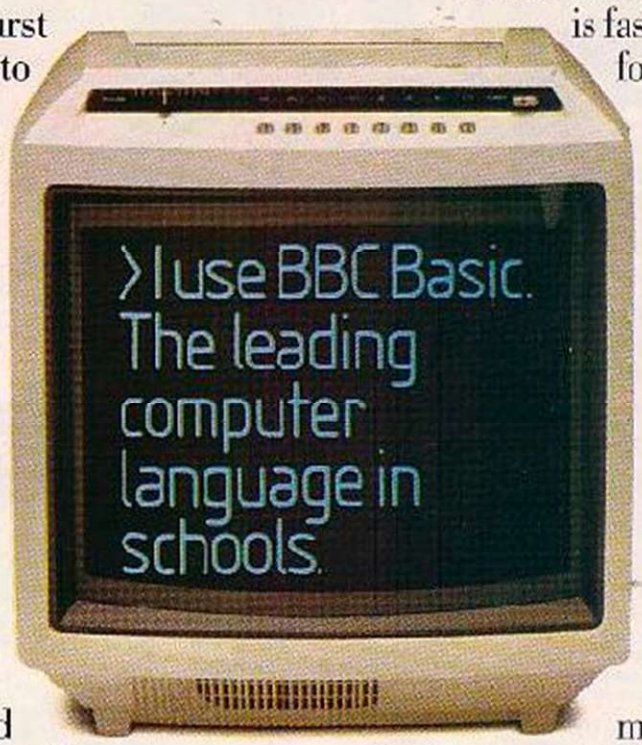
You see, the Electron is the first micro remotely in this price range to use BBC Basic, the computer language that is rapidly becoming the standard in British schools.

But that's not all. Most children will feel at home with the Electron as soon as they lay hands on it.

This is because it has developed out of the Micro that has been chosen by over 80% of schools participating in the Government's current Micros In Schools project. It has a similar keyboard and has most of the functions of this much acclaimed (but naturally, more expensive) machine.

So now children will be able to continue their computer studies at home. They'll be able to use the same educational programs they use at school. And, if asked nicely, they'll be able to help willing adults take their first steps into computing.

All this for only £199.



A micro technology break-through.

And now a few reasons for adults why the Electron is such an exceptional machine at the price.

The Electron is neat and compact. Yet it is fast and powerful. (Full details, for the technically minded, are in the box opposite.)

It produces high quality sound using its own internal speaker.

And it offers a range of facilities many larger more expensive machines just cannot match.

For example the Electron's colour graphics have the highest resolution of any home computer.

This is because the chip that controls the graphics, specially designed by Acorn, is one of the most advanced of its kind. As a result, the Electron delivers twice as many characters across the screen as its closest competitor.

Built to last and to grow.

The Electron has been designed and built to be a permanent part of the family, year in year out.

Particular care has been paid to the keyboard. It is electric typewriter style: robustly constructed with a good, solid 'feel'. It has a space bar, and single entry keys for key commands.

In other words it's comfortable and easy to use, avoiding the need for the manual gymnastics sometimes associated with calculator style keyboards.

And it will grow with you via expansion modules, that Acorn are developing, to take peripheral additions such as printers and disc drives. So as your knowledge, interest and ambitions develop, the Electron can develop with you.

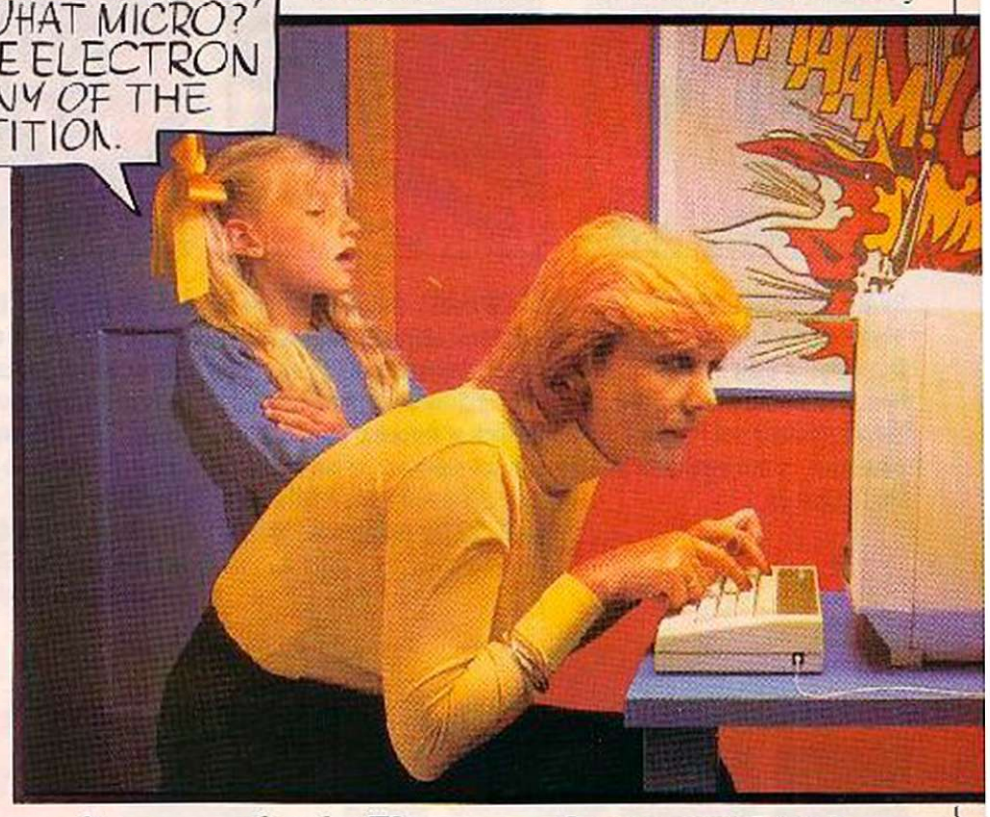
Additionally, to give you all the support you'll need to generate your own applications software, we've established a phone-in service attended by specialists to give advice, encouragement and practical help.

A gentle teacher.

The Electron plugs straight into virtually any TV set and cassette player so you will be

ready to go as soon as you get it home.

It comes not only with a comprehensive user guide, which describes the machine and its functions, but also with a book that takes you step by step through the basic principles of programming.



A free taste of its versatility.

You will also receive an "Introductory" cassette which will put the Electron through its paces showing you a little of what it can do with its 64k of memory (32k ROM, 32k RAM).

The cassette will give you a taste of those exceptional colour graphics we mentioned earlier; of its ability to play and notate music, and show you how it might help in home accounting. It will challenge you to a few games and will, if you ask it, do your whole family's biorhythms in a matter of seconds.

You will in short, through the 15 separate programs it contains, get a glimpse of the Electron's potential. But only a glimpse, for that potential is as limitless as your own interest and imagination.

A widening range of software.

To help you realise some of that potential, Electron software already ranges from "Personal Money Management" through "Starship Command" to "Creative Graphics" (which, incidentally, includes some spectacular three-dimensional rotating shapes). Naturally, with its strong educational links, educational software will be extremely important for the Electron and even now O and A Level revision papers are being processed for Electron users.

How to get your Electron.

The Acorn Electron can be found at local Acorn dealers and major high street stores. However, if you would like to order one with your credit card, or if you would like the address of your nearest supplier, just phone 01-200 0200.

Technical Specifications	
Hardware. 2MHz 6502. 32K ROM 32K RAM (64K total). High resolution graphics 640 x 256 max. Seven display modes. 8 colours and 8 flashing colours. 1200 baud CUTS tape interface with motor control. Expansion bus for add-on interface modules. Internal loudspeaker. PAL UHF output to colour or black and white domestic TV. RGB output for colour monitor. 56 key full travel QWERTY keyboard with spacebar.	**Software.** BBC BASIC. Extensions include interger, floating point and string variables, multi dimensional arrays: IF...THEN...ELSE, REPEAT...UNTIL, procedures with local variables. Operating system allows plot, draw and fill commands. Event timing. Built-in assembler. 6502 assembly language can be mixed with BASIC.

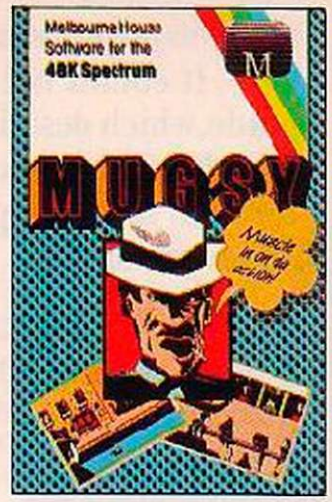
The Acorn Electron.

DRAGON HUNGRY HORACE. It has been said that Horace games are in a class of their own. In fact, Horace is almost a legend. Hungry Horace, the original Horace adventure, is now available for the Dragon 32.

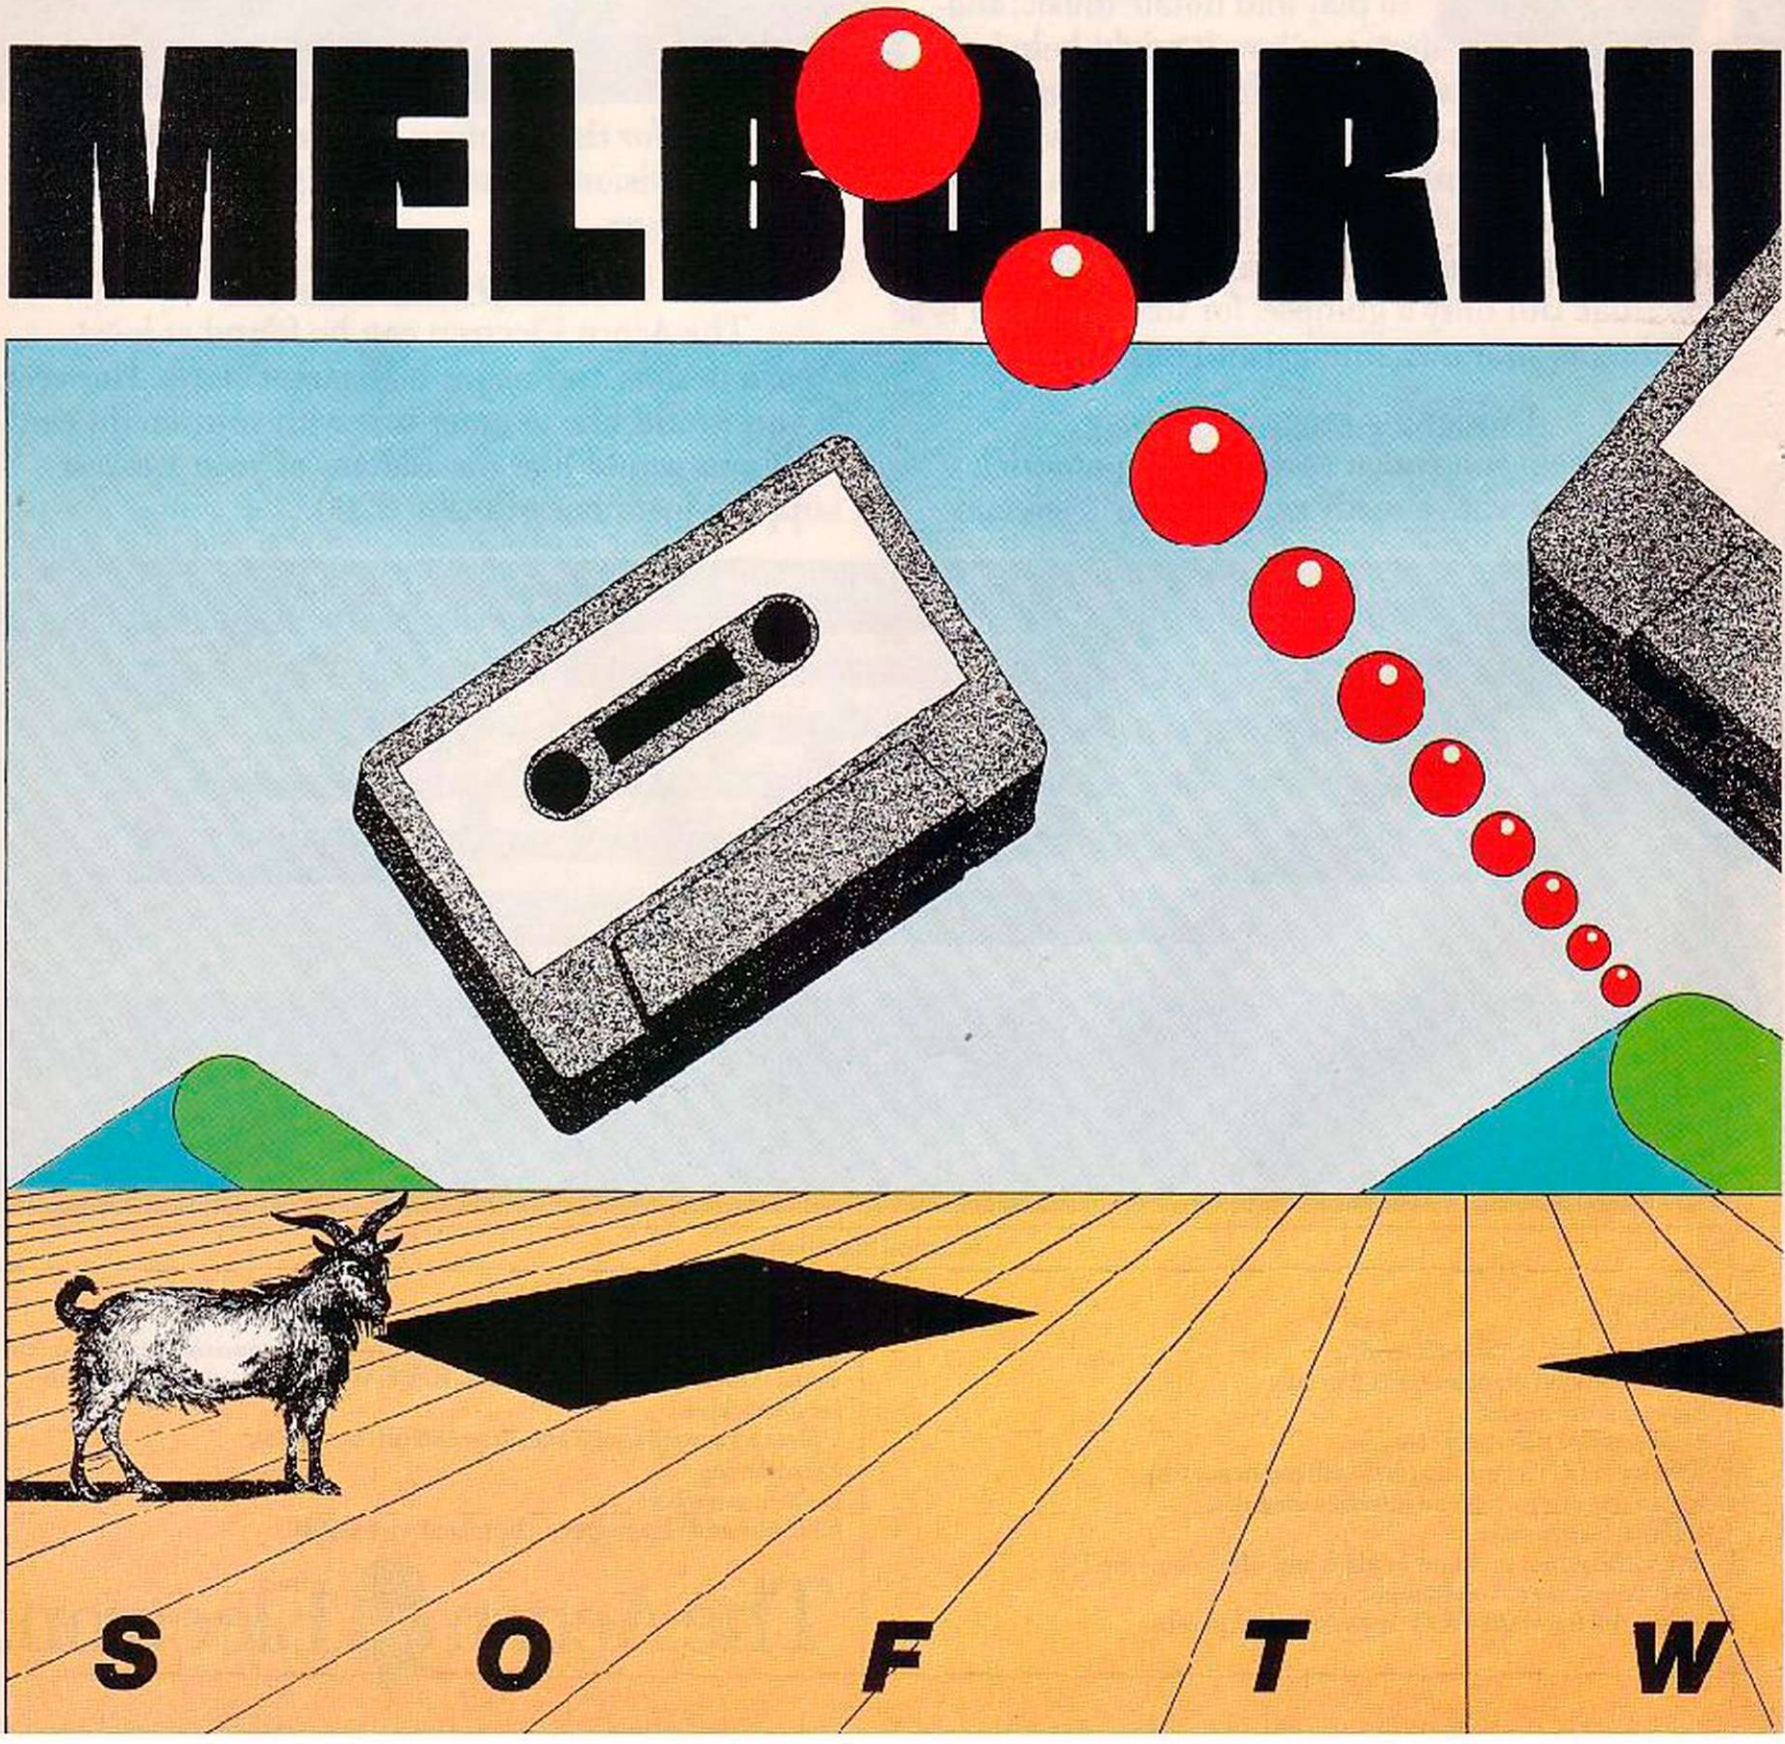
COSMONAUT. Written entirely in Machine Language, Cosmonaut is an exciting and challenging game of arcade strategy. Works with joystick or keyboard and features moving elevators, storm troopers, laser guns and more. A full screen game for the unexpanded VIC 20.

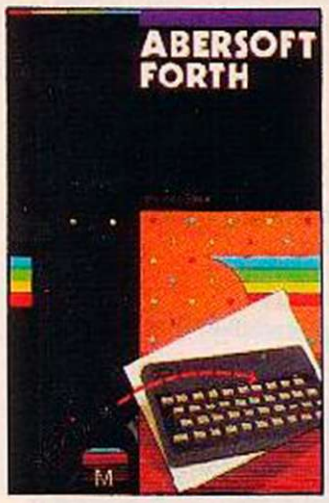
THE HOBBIT. Visit J.R.R. Tolkien's Middle Earth in the most amazing adventure yet devised. "A game by which future games will be judged." — Personal Computing Today. "Superior to any other adventure game." — Your Computer. The Hobbit is now available for the BBC, Oric, Commodore 64 and Spectrum.

H.U.R.G. A revolutionary piece of software for your 48K Spectrum which allows you to develop high quality Machine Language arcade games with absolutely no programming experience. "It is difficult to find fault with such a complete games generation program." — Crash.



MUGSY gives a totally new direction for thrill seekers — comic animation in text, stunning graphics and a full arcade game! Mugsy is your one and only chance to become the greatest gang leader with definite ill repute.





FORTH. Abersoft Forth is an implementation of the Forth Language for your Spectrum 48K. Forth is closer to Machine Code and more than 10 times faster than BASIC. "The only Spectrum package which has been endorsed by the Forth Interest Group" — Sinclair User.

PENETRATOR is one of the most challenging arcade games for the 48K Spectrum. Amazingly fast arcade action includes training mode and unique customising feature. "Penetrator is my pick — the graphics are terribly impressive . . . a most enjoyable and addictive game." — Computer and Video Games.

COMMODORE 64 HORACE GOES SKIING is the sequel to the very successful Hungry Horace. In this adventure our hero attempts winter sports. Skiing is complete with slalom flags, trees and moguls so watch out Horace!

cp software — Commodore 64 and Spectrum Programs

SUPERCHESS 3.0

ABSOLUTELY GUARANTEED ABLE TO CONSISTENTLY BEAT ALL OTHER SPECTRUM CHESS PROGRAMS

★ Declared 'Champion of Champions' by Computer Choice Magazine Chess Championship (May 1984)

★ Achieved overall 50% against graded human players at its local Chess Club

Superchess 3.0 has been developed to bring you the strongest chess program yet for the Spectrum computer.

At the tournament level Superchess 3.0 has a look-ahead of five to seven ply (moves) in the middle game and ten to twelve ply in the end game. This gives Superchess 3.0 a substantial advantage against other chess programs and promises the experienced player an interesting and challenging game of chess.

Unlike other chess programs, Superchess 3.0 is not just a brute-force calculator, but employs artificial intelligence techniques to allow deeper searching along the main lines of play.

FEATURES:

- 10 levels—all play within tournament time limits.
- First level made especially easy for beginners.
- Easy to use—help menus provided.
- Recommended move option.
- Change sides and level during game.
- Self play mode.
- Set up/change position.
- Technical information—how the program 'thinks'.
- Program's internal score for position displayed.
- Number of evaluated positions displayed.
- Library of opening moves.
- Select your own colour scheme for graphic board display.
- Solve mating problems—up to mate in four.

48K SPECTRUM—Price £8.95

PINBALL WIZARD

Available for any SPECTRUM or COMMODORE 64

Superb colourful fast-action graphics and sound give this game the feel of a real arcade pin-table. Realistic launch flippers, bumpers, high-score, bonus scores and freeball features. Be a Wizard!

"...I thought that a few minutes would suffice, and then found that a couple of hours had passed and I was still at it. Excellent...Pinball Wizard has it made." CRASH MAGAZINE

"A brilliant idea that's totally absorbing and so addictive..." YOUR SPECTRUM

"The display is well-designed and colourful and ball movement is very realistic." PERSONAL COMPUTER GAMES

48K SPECTRUM—£5.96
COMMODORE 64—£6.95

BRIDGE PLAYER

PLAY AN ENTIRE GAME OF BRIDGE AGAINST YOUR SPECTRUM —WITHOUT GETTING IN THREE FRIENDS FOR THE PURPOSE
FINAL IMPROVED VERSION NOW AVAILABLE

Dealing—the program shuffles, deals and sorts the cards to produce randomly dealt hands. An almost infinite number of hands are therefore possible, with all kinds of distributions.

Bidding—is in the familiar ACOL system, including Stayman and Blackwood conventions. You bid your hand while the Spectrum bids the other three hands.

Card Play—you play from your own and dummy's hands, which are displayed as they would be at the bridge table, with the program playing the other two hands.

Scoring—at the end of each hand the score is calculated, including honours, slam and rubber points. Both the old and new scores are displayed in the usual manner.

Replay—at the end of each hand, all four hands can be displayed and, if desired, the hand replayed.

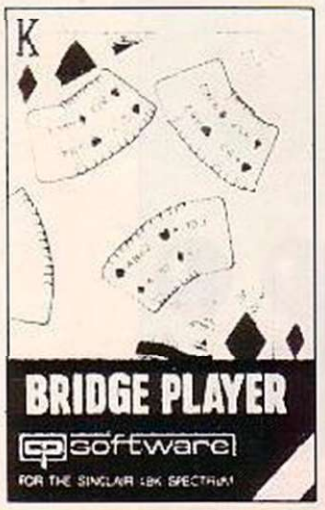
48K SPECTRUM
BRIDGE PLAYER—£8.95

An ideal complement to the Bridge Player Program:

Bridge Tutor (Beginners)—**£5.95**
Bridge Tutor (Advanced)—**£5.95**

SPECIAL OFFER:

Bridge Player and both Bridge Tutors—£18.95



SUPERCODE II

—for 16K and 48K Spectrum

NEW!!

120 ROUTINES—MICRODRIVE COMPATIBLE 100%

This is the Ultimate Spectrum Toolkit, with 120 State of the Art Machine Code Routines for use in, or with, your own BASIC programs! Supercode II needs no prior knowledge of Machine Code to operate. If you have a ZX Microdrive, you can transfer Supercode II to Microdrive as easy as 1-2-3...if you do not, all the other features of Supercode II still work.

★ Unique Access Program lets you Index, List, Test, Tailor, Relocate and Save (to Tape or Microdrive, with original or new name) + Verify routines, all under software control. ★ Options include Example/Repeat/Jump/Again/Cont/Demo/Diagnosis/Tfr. ★ See each routine work—all details onscreen. ★ Supplied boxed with Comprehensive User Manual. ★ Guaranteed fastest and shortest routines for every application!

Sinclair ZX Microdrives and ZX Interface 1

The affordable alternative to floppy discs...

...in the shops, now!

The unique ZX Microdrive system sets the ZX Spectrum apart from all other computer systems.

At a fraction of the cost of floppy discs, it gives fast access to 85K of program and data on Microdrive cartridges. And it opens up exciting possibilities through an RS232 interface and local area network.

ZX Microdrives – the fast way to save or load 85K of program and data. £49.95

ZX Microdrives are controlled by ZX Interface 1.

For their compact size, they're massively powerful. Each interchangeable Microdrive cartridge stores at least 85K of program and data!

You can create up to 50 files on the cartridge – identified by titles of your own choice.

And when you want to display the data again, Microdrives give you lightning-fast access:

- Just 3.5 seconds to access a typical file.
- Only 9 seconds to LOAD a typical 48K program.

ZX Microdrives use the Spectrum's own power supply.

Your first Microdrive is connected to Interface 1 by a Microdrive lead. Then, up to 7 more Microdrives can be added using Microdrive connectors. That gives you a minimum of 680K bytes of on-line capacity.

With memory like that, the possibilities are limitless – stock control, word-processing, even huge adventure games!

With each Microdrive, you'll receive a Microdrive connector and Microdrive demonstration cartridge. Blank Microdrive cartridges cost £4.95 each. They are available in packs of 4 (with a free cartridge wallet) or singly.

ZX Interface 1 – the multi-purpose controller. £49.95

ZX Interface 1 is a multi-purpose device. It controls up to 8 Microdrives. And it adds file-handling and communication facilities to your Spectrum.

So in one low-priced unit, you also get these two built-in features

- **RS232 interface** This industry standard interface allows you to link your Spectrum with full-size printers, communicate with other computers employing RS232, and transmit data over telephone lines via modems.
- **The ZX Net** Now you and your friends can transfer programs and data on a local area network – or even play computer games together.

The ZX Net makes it easy, and fast!

It links between 2 and 64 Spectrums, transmitting at 10,000 characters per second. (So a full screen is transferred in around 3 seconds!) With the ZX Net, only one person need type in a program. And a Microdrive or printer can be shared by everyone in the network!

ZX Interface 1 offers you all these facilities, and retains the same peripheral port as the Spectrum itself.

With each ZX Interface 1, you'll receive a connecting lead for the first Microdrive; a ZX Net lead with jack plugs; plus a comprehensive manual.

An RS232 lead is available as an optional extra at £14.95.

Available from: larger branches of Boots • WH Smith Computer Stockists • Greens Computer Centres • Spectrum Computer Stores • and larger branches of John Menzies • Dixons • Laskys • Currys • John Lewis Partnership • Rumbelows • British Home Stores • House of Fraser and many other good computer stockists nationwide.

Find out more – in your local shop!

The best way to evaluate ZX Microdrives and Interface 1 is to see them for yourself.

There is a full range of ZX peripherals – including ZX Interface 2 for joystick and ROM Cartridge capability, alongside the only computer that supports them – the ZX Spectrum!

For more information, telephone Sinclair Research Ltd, on 0276 685311.

™ Sinclair, ZX, ZX Spectrum, ZX Microdrive, ZX Net and ZX Interface are trade marks of Sinclair Research Ltd.

sinclair

Small business can now stop going by the book.

For under £1,000 a small business can now equip itself with a BBC Microcomputer, a disc drive, a word processor and printer.

(All tax deductible by the way.)

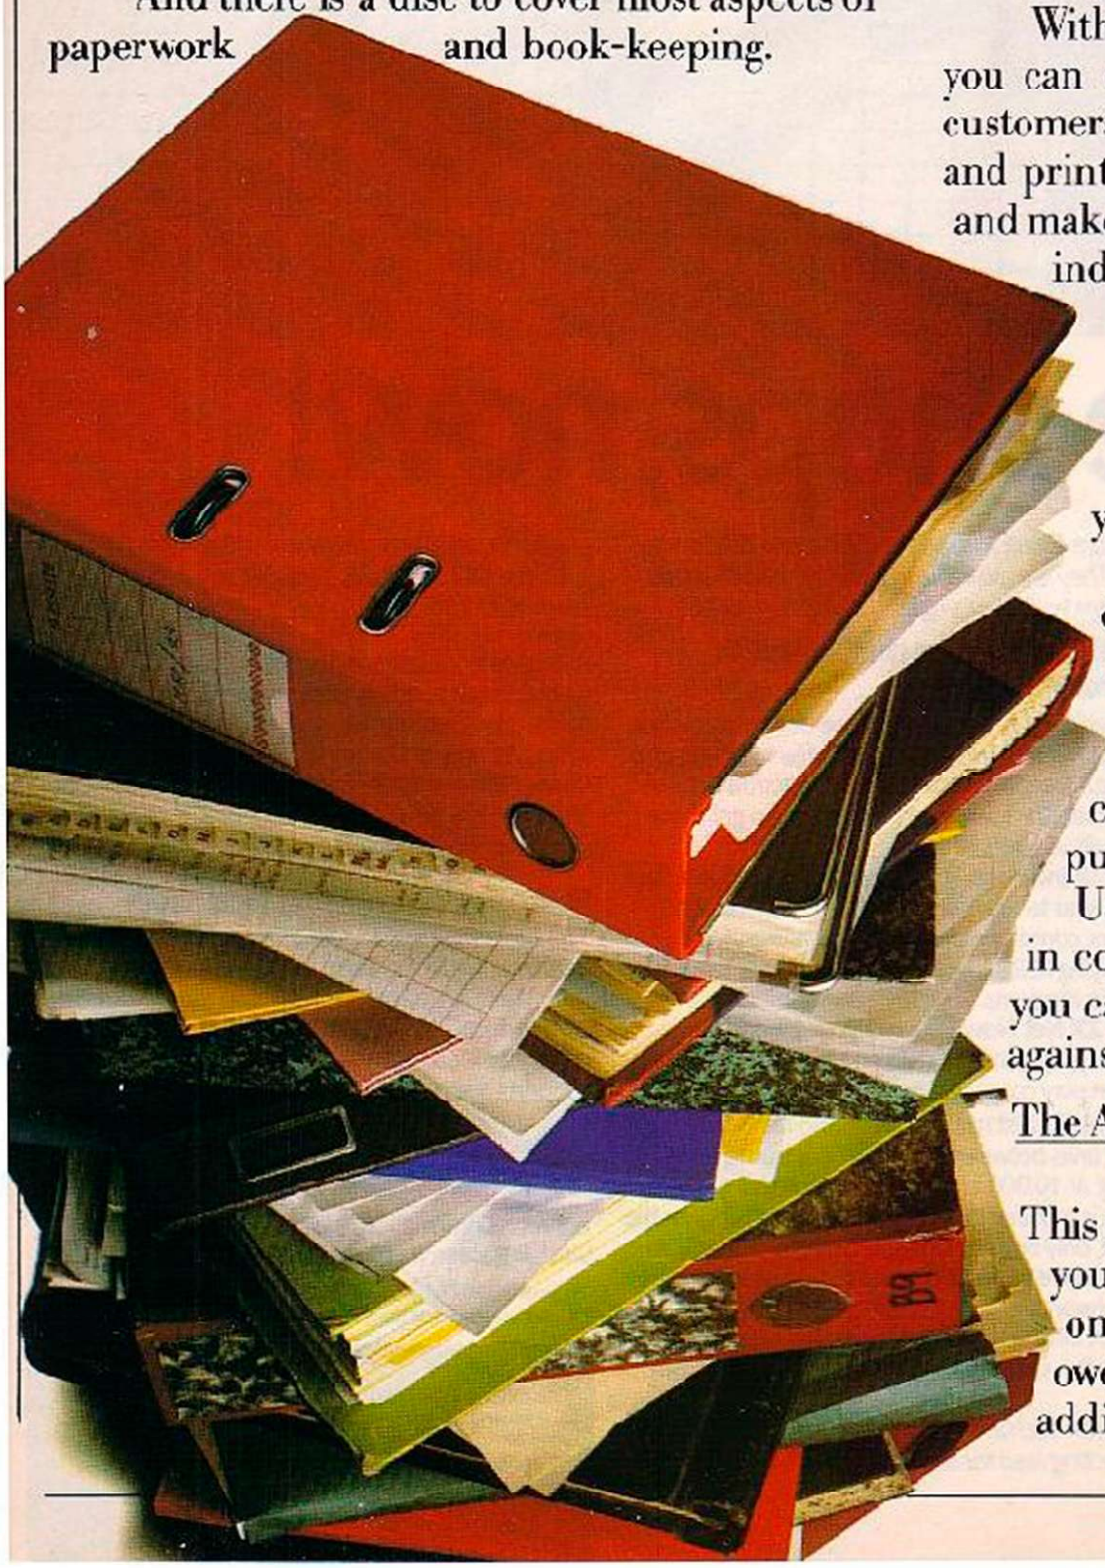
Once you've parted with that money, you'll find that business has never been brisker.

Because now, there's a new series of floppy disc software specially for the smaller business.

It has been developed by Acornsoft, the software division of Acorn Computers who are the manufacturers of the BBC Micro.

For only £24.95, each disc can store volumes of vital bookwork which can be updated and amended in a fraction of the conventional time.

And there is a disc to cover most aspects of paperwork and book-keeping.



The Invoicing package.

This program stores details of products, VAT numbers and, of course, the names and addresses of your customers. As orders come in, you simply record them. Then, when it's time to invoice, you just press a few keys and each invoice or credit note is printed automatically in seconds.

Allowing for variable terms of trading, the system calculates and prints discounts. And it should help to improve your cash flow dramatically.

The Order Processing package.

With this program, you can confirm your customers' orders, prepare and print despatch notes and make fast analyses of individual orders or of all the orders stored on disc.

The Accounts Receivable package.

Now, it couldn't be easier to keep your customer accounts under control.

In an instant, you can analyse debtors, produce statements, keep a check on any credit limit and calculate VAT output automatically.

Using this package in conjunction with the invoicing package, you can also keep tabs on payments received against payments outstanding.

The Accounts Payable package.

This package will keep you fully up-to-date on how much you owe and who to. In addition, it calculates

input VAT and, used with the Accounts Receivable package, produces instant VAT returns.

It also highlights settlement discounts, produces remittance advices and provides an immediate analysis of all creditors.

The Stock Control package.

Touch a few keys and you have instant access to stock status and automatic analysis by quantity and value.

Consequently, it's easy for you to maintain correct stocking levels, having an early warning of out-of-stock situations or the likelihood of over-stocking.

The Purchasing package.

All your suppliers' names and addresses go onto the disc. Then they can be retrieved instantly for preparing and printing orders.

All order data can be recalled in seconds, allowing you to check on orders, and suppliers' invoices and to record all deliveries.

The Mailing package.

Instead of the shotgun method of sending mailshots, this package enables you to refine each mailing down to the customers who are most likely to respond.

It gives you a rapidly accessible mailing file of your customers, according to any criterion you choose. Size of company, for instance, or type of business. Average value of the business they do with you, or whether they are good or bad payers.

Then, when you are doing a mailing, you simply choose the group or groups of customers you want.

At £24.95 each, these packages could be priceless.

Each package comes with clear instructions on how to get the program running so that you can devote much more of your time to more profitable activities.

If you're a credit card holder, you can order any or all of the packages by ringing: 01-200 0200 anytime. Or 0933 79300 during office hours.

(By ringing the same number, you can get the address of your nearest stockist, or full details of the BBC Microcomputer system if you don't already have one.)

Alternatively, you can order the packages by sending the order form below to: Acornsoft, c/o Vector Marketing, Denington Estate, Wellingborough, Northants NN8 2RL. Please allow 28 days for delivery.

☎ Credit card holders, phone 01-200 0200, anytime. Or 0933 79300, during office hours.

To: Acornsoft, c/o Vector Marketing, Denington Estate, Wellingborough, Northants NN8 2RL.
Please send me the following business software packages at £24.95 each.

The Electron £199.00

Another Winner From the Big M Stable

The Electron — A thoroughbred from the manufacturers of the BBC, who have incorporated all their experience and knowledge to conceive another winning computer. Many BBC programs are compatible. This full colour 32K ROM and RAM computer with text and graphics includes a cassette input, and a multi-way connector for the addition of expansion units containing interfaces to additional hardware. It has a 56 key full travel QWERTY keyboard, 10 user-definable and 29 pre-defined keys enabling BASIC keywords to be entered in a single keystroke. The Electron comes with free introductory cassette containing 19 programs including a number of exciting games. £199.00

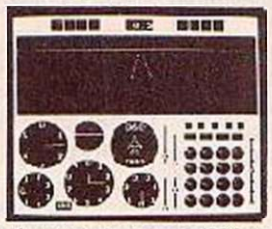
747 Flight Simulator

from DACC — The Simulation specialists



Actual screen photograph (BBC version)

Unrivalled and unbeatable for accuracy and realism — the DACC 747 Flight Simulator is the most successful of its kind on home computers. The only simulator which shows all the essential flight and engine instrumentation of the Jumbo Jet, as they really are — real dials — and with a precise 3D view of the runway. The control and response of the 747 are faithfully reproduced using genuine aero-cynamics formulae. Start options include take-off, random landing approach, passenger and fuel load selection, etc. You control the throttles, elevators, ailerons, flaps, spoilers, landding gear, brakes, reverse thrust, etc. Joysticks are optional on all but Dragon and Tandy versions.

Cassette £9.95 (inc. VAT and P&P)

Special Officer on Joysticks

Normally £17.95 per pair. Yours for only £12.95 if ordered with 747 Simulator (Atari & CBM-64 types £14.95).

Please state type of computer on all orders.

WE DESPATCH WITHIN 48 HOURS

HEARING IS BELIEVING

Tele Sound

SPECTRUM BEEP BOOSTER

TELESOUND is ready built and tested so that you can get the full sound of your Spectrum through any unmodified television set, black and white or colour. The unit is easy to fit in minutes without any previous experience as full fitting instructions are provided.

TELESOUND has been designed using the very latest ultra miniature components so it's size is an incredible 2x1.3x1cm. and fits neatly inside the Spectrum. Three easy push-on connections are made to the Spectrum. The connections are clearly shown in a diagram that comes with full fitting instructions.

TELESOUND FEATURES

- SOUND AND VISION TOGETHER FOR ADDED REALISM.
- BEEP VOLUME CONTROLLABLE FROM A WHISPER TO A ROAR.
- KEYBOARD CLICK CLEARLY HEARD TO ASSIST PROGRAM ENTRY.
- PROGRAMS CAN BE HEARD WHEN BEING LOADED • NO SOLDERING OR CASE CUTTING REQUIRED.
- ADDITIONAL AMPLIFIER NOT NECESSARY • SEPARATE POWER SUPPLY NOT REQUIRED.
- USES NO MEMORY SO WORKS WITH ALL PROGRAMS • COMPATIBLE WITH ALL OTHER ADD-ONS INCLUDING MICRODRIVE

TELESOUND comes complete with easy to follow fitting instructions and costs £9.95 inclusive of post, packing etc. Please state your computer when ordering.

HOW NOT TO SELL A COMPUTER

I would like to bring to your notice the attitude of certain computer dealers and their sales representatives towards younger people with an interest in computers.

This attitude is clearly illustrated in the following case which happened to me a few weeks ago. At that time my father had just decided to buy a personal computer with the specific application of word-processing in mind. My father, however, knows nothing about computers, and is also very busy, and asked me to do some research for him into the best computer he could get for his money. I acted accordingly, and narrowed the field down to three computers.

I eventually found a dealer who sold all three computers and 'phoned them up. I spoke to a very helpful man who fully realised my age and after a short discussion suggested that I came down to their showroom at some point that day for a demonstration. I was very pleased at this suggestion and went down to the showroom in Hammersmith later that afternoon. When my friend and I arrived we were greeted by a very fat, patronising man who told us that they did not stock all the computers they claimed to stock, we could not have a demonstration of the computers we were interested in, and could we please bring our "old man" down to the showroom; and then he would take, not us, but my father seriously.

Yet, earlier that day we had been told by a man working for the same people that we would be welcome to a demonstration, whether or not we were with my father. We had spent an hour and a half getting there and back, and had done absolutely nothing. What annoyed me most about this was that the dealer in question did not have a definite policy on whether or not to serve children, and accordingly missed out on making a sale of a £2000 computer. This seems to me to be a typical case of bad salesmanship in a country where there are so many young computer users. Dealers should judge their customers by knowledge rather than age.

Dominic Young (15).

FASTER DRAGON

As you may know the Dragon has three speeds built in, but the fastest and most least used speed is of great value to utility and number crunching programs. Although the video chip is interfered with, the program still operates as normal but at a higher speed.

Everybody knows the Poke 65495,0 to speed up the program and Poke 65494,0 to slow it down again, and still use the screen as normal. With the exception of the cassette interface, more about that later.

To work at an ever faster speed with the loss of the screen you must place Poke 65497,0 in your program. It will not work any other way as you lose control of the computer if it is not running a program. Also I cannot stress the importance of the Poke 65496,0 when you wish to return to normal as if you do not you will have to Reset to regain control but your program will not be lost.

To show you some results I have used a stop watch to time these results for a loop of 10,000 and it would appear that the internal clock is not changed by the speeding up

A: normal speed time taken is 9.7 seconds
After POKE 65495,0 time is 7.06 seconds
After POKE 65497,0 time is 4.6 seconds

If you have ever used Poke 65495,0 before then you must, at one time, have saved a program at that speed and switched off without checking the program by SKIPF — as this does not New the program.

To reload a program saved this way type Poke 65497,0:CLOAD (Enter). The screen will go blank so you will have to watch the tape to see when it has finished loading and then either type Poke 65496,0 or reset and List. Your program should be alright but sometimes corruptions may take place as the cassette interface was not designed to operate at that speed.

Then be sure to re-Save your program to avoid another loss of hard work!

Bruce Low,
Hanston,
Renfrewshire.

SAVING VU-FILE

My most useful program is Psion's Vu-File. I eagerly awaited the arrival of my Microdrive to speed up operations, but trying to save files on the Microdrive resulted in failure as Vu-File had overwritten the Microdrive channel. After several attempts I hit upon the following method of using Vu-File with the Microdrive, which means that existing files can be loaded from cassette and saved on Microdrive or cassette. Vu-File itself can also be saved and loaded from Microdrive.

Proceed as follows:

1) Load Vu-File from cassette as normal.
2) Break out of the program by selecting "Load a file from tape" and pressing Break when loading starts.
3) New the Basic, the machine code is safe beyond RAMtop.
4) Save the machine code on the Microdrive with the command
   SAVE * "m" ; 1 ; "C" CODE 25083,5640
5) Enter a new shorter Basic program:
   50 CLEAR 25087: LOAD * "m"; 1; "C" CODE DIM f$(32) LET a = 29785: GOTO USR 29721
   1000 CLS:PRINT "SAVE FILE": GOSUB 3000:GOTO USR a
   1005 PRINT "ENTER SAVE COMMAND g$ CODE s, 1 THEN GOTO USR a":STOP
   2000 CLS: PRINT "LOAD FILE": GOSUB 6000:PRINT "ENTER LOAD COMMAND g$ CODE s THEN GOTO USR a":STOP
   3000 LPRINT f$(TO 32):GOTO USR a
   6000 INPUT "FILE NAME",LINE c$: LET f$(TO 10) = g$: LET s = CODE f$(11) + 256 * CODE f$(12): LET l = CODE f$(13) + 256 * CODE f$(14): RETURN
   Do not alter the line numbers.
6) Save on Microdrive with:
   SAVE * "m" ; 1 ;"VU-FILE' LINE 50

Vu-File can now be loaded from the Microdrive with the normal Load command. It will behave normally until a Load or Save situation occurs, then it will return to Basic. At this point enter an appropriate Load or Save command for cassette or Microdrive operation with g$ CODE etc as printed on the screen. When completed return to Vu-File by entering Goto USR a.

Not only does this method save the cost of buying another filing program, but it also means that all existing Vu-File files are compatible, and do not have to be re-entered.

F.J.S. Lewis,
Abbots Langley,
Hertfordshire.

NON VIOLENCE

Play for Life is currently compiling a guide and it is intended to include a section on computer programs. Our primary concern is for playthings for the five to 12 year olds, but our interest extends to children of all ages. I would be most grateful if any software houses who feel they publish suitable programs would send me these.

The criterion for inclusion is that the programs should be constructive, creative entertainment. Thus we are looking for utilities that encourage the users to extend themselves, and their imaginations. Graphic and music utilities are excellent examples.

The sort of games that we're looking for may be harder to qualify, perhaps because there are so few of them? Alien zapping, dragon slaying games are definitely out! Dictatorial power simulations are similarly excluded. A lack of overt violence is no qualification, such games may still be aggressively competitive. So what are we looking for? Simulations that deepen understanding, role play games wherein the player helps others, arcade games that encourage co-ordination and swift reaction, but not if they depend on or include violence and aggression, and how about multi-player games that require the participants to work together?

We are greatly encouraged by the increasing media interest in Play for Life. Its first meeting in February received extremely sympathetic coverage on 3BC Radio 4 and positive interest has been already shown by some of the quality press, not only in the Play for Life idea, but also specifically in appropriate computer software.

Keith Ollett,
Computer Games Researcher,
Hookstead, Goldsmith Avenue,
Crowborough, East Sussex TN6 1RG.
Telephone (08926) 5832.

QL VALUE

I write with reference to Anthony Briggs' letter in your May issue concerning the Sinclair QL computer.

I totally agree with his point about Sinclair's poor customer service record, although I cannot say that I personally have had any cause for complaint.

I would also agree with his view of Sinclair hardware — I too find it a joy to work with. However, the fact that he can consciously reject Sinclair hardware in favour of the Japanese MSX computers amazes me, especially in light of the QL. In the same issue of your magazine we are told a few of the features of the QL that the advertisements don't reveal: definable character size, number range 10^{-615} to 10^{615}, strings to length 32K, etc, etc. Show me an MSX computer which does all this for a better price and I'll eat my QL when it arrives!

With all due respect if Mr Briggs feels happier bashing Japanese plastic on a games-orientated machine, then who am I to say? When deciding what hardware I buy, I base my decision largely on getting value for money, and I consider paying £399 for a machine with features belonging to a £1000+ machine an incredible bargain, even if I do have to wait three months for delivery.

Kevin Ball,
Shepshed,
Leicestershire.

VIC THINGS

I feel I must write to complain about the misleading comments made in *Your Computer*, June 1984.

I am referring to the article on page 39 by Andrew Bacon entitled Things to do with your Vic.

In this article Andrew gives some interesting tips, programs and ideas. It is only the following comments that I wish to rectify.

☐Graphic 4 does not exist. If it did it would be in the Super Expander manual. It is a repeat of Graphic 0 which resets the Vic, giving back the memory that a graphic mode uses up. The computer logically Ands the parameter after Graphic with 3 to obtain a number in the range 0-3. Following this argument both Graphic 0 and Graphic 4 are valid and so can be used before a Graphic

command as well as after. I have done this and my Vic-20 doesn't crash.

□Andrew says that to unplot a pixel on the Super Expander, a non-system word can be entered, preceding the colour register number.

Any computer fan will realise that a non-system word is a floating point variable name and thus what Andrew has done is to replace the colour register number with an undefined variable name, effectively a colour register number of zero. In the manual zero uses the screen colour. Making a pixel the same colour as the screen effectively unplots it.

Using his example:
CIRCLEOVER 2, 512, 512, 320, 460 is actually CIRCLE OV2 512, 512, 320, 460

Obviously if OV2 is 0 unplotting will result. If it is greater than 0, plotting will result according to the value of OV2.

□Peek(650) — Location 650 may contain other numbers causing no keys to repeat. I may be wrong, but I believe the coding is:

0 = no keys repeat
64 = Cursor/Space Bar repeat
255 = all keys repeat

This leads me to suggest that the most significant bit affects all keys except Cursor/Space Bar ie:
128 bit set = keyboard keys repeat
64 bit set = Cursor/Space Bar repeat;

□Peek(37159), Peek(36967). These locations do change the speed of the cursor but this is due to the fact that it represents the Hi Byte of Clock Generator 1 which generates the IRQ interrupt signal. I doubt very much that programs can run faster, only apparently slowed down.

□Peek(36867). This location does not just change the length of the screen, but also effects the size of the characters. The selection of different size characters is done by the least significant bit.

If it is set then 8 by 16 characters result — not 16 by 8 as stated in the user guide. 16 by 8 would have been more useful. If it is not set, normal 8 by 8 characters are apparent. The normal value here is 46 which means 46/2 = 23 screen lines and normal 8 by 8 characters. Poking 36867 with 47 would give 8 by 16 size characters.

Lee Borrell,
Audenshaw,
Manchester.

VIC PROTECTION

I have noticed that as far as program protection is concerned on the Vic-20 that we have been limited to disabling the Run-Stop key with a simple Poke.

However all this is about to change, with the aid of the following:

Disable List: If, for some reason, the program concerned caused an error it would be nice to prevent anyone from listing the program. There are two ways of doing this and they are as follows:

POKE 774,34:POKE 775,253

This will cause a warm start if List occurs.

POKE 774,116:POKE 775,196

This will give a syntax error if List occurs.

Disable Save: Now that your program is un-listable you must prevent it from being saved and then re-loaded later in order to gain a listing. Again there are two methods of doing this:

POKE 818,34:POKE 819,253

This will cause a warm start if Save occurs.

POKE 818,116:POKE 819,196

This will give a syntax error if Save occurs.

Disable Load: This will stop anyone loading a program which will re-set the above locations and enable them to copy your program. This is done as follows:

POKE 816,34:POKE 817,253

This will cause a warm start if Load occurs.

POKE 816,116:POKE 817,196

This will give a syntax error if Load occurs.

Disable Run-Stop: This is included for completeness and is done as follows:

POKE 808,127

Kevin Willers,
Rotherham,
South Yorkshire.

CORRECTIONS

Listing 7 in July's BBC Sprites article contains an error. The second part of line 540 — starting with N5 — belongs instead to line 550 and should be tagged on to the end of the line after BC5.

MSX — TOO LITTLE, TOO LATE?

I found your criticism of the MSX project — June Editorial — bang on target. With the arrival of home systems such as the Sinclair QL and the Advance 86A, I see only dark clouds gathering for anyone daring to launch a new eight bit micro, standard or not.

The MSX lobby also fail to take into account the following, which clearly shows their improvident approach to market domination.

A. The large number of present users who will upgrade to the more powerful systems now becoming available; which will cause an expansion in the second-hand market, of proved micros with software and add-ons a-plenty.

B. A price war between manufacturers, of presently produced eight bit micros.

C. The growing acceptance of the user-friendly concept, which by its very nature makes demands on memory that the eight bit is unable to comply with.

D. A first time user can learn equally as well on a 16-bit, running Basic.

E. Who wants to buy a "Model T" when a "Rolls Royce" is available for a few pounds more?

The MSX project can be summed up in four words, *too little, too late.* However, I believe UK consumers will welcome it as it will force home manufacturers to produce 16-bit systems. It would also be to the good if they acopt a 16-bit standard with the CPUs being produced here to prevent embarrassing component shortages of the type which occurred last year.

A future article from *Your Computer* would not come amiss addressing the following: Why are there so few powerful systems of the above type in the home users price range? What type of CPUs could be used? What type of advantage/disadvantages does a 16-bit offer in terms of software, useable RAM, graphics, sound and storage?

B. Brecknock,
Nottingham.

How to write for *Your Computer*

We called this magazine *Your Computer* precisely because we welcome your views, tips and hints and even your criticism of machines and software in general. If you would like to see your name in print, whether on a Software File program or a full-blooded article, here is how to go about it. Ideally, all articles should be typed double-spaced on one side only of uniform sheets of paper. If listings can be dumped directly from a printer — you can always use a friend's or user group's — this minimises the risk of error. In a perfect world a cassette would accompany the article. That considerably speeds up the checking process. Not only do you get to air your own discoveries and opinions, but we will even pay you for the privilege. We pay £35 per published page — that's as it appears in the magazine and includes illustrations.

Why not give it a try? You have nothing to lose but your postage.

HEALTHCARE FOR YOUR HARDWARE

When your Commodore 64 seems distinctly unwell it's hard to know what to do.

Which is why you need 64 Doctor.

This special program will find the fault by a series of short diagnostic tests. And tell you exactly where the problem lies.

Included are tests for RAM, keyboard, disc-drive, joysticks, datacassette, printer, audio and video displays.

So as well as saving you pounds in having someone check through the whole system for a fault, 64 Doctor will give you peace of mind.

You can give your system a check-up by visiting any good computer store including selected branches of Laskys, W. H. Smith and Boots.

64 Doctor. Tape £17.95 inc. VAT. Disc £19.95 inc. VAT

Computer Fair provides first public showing for Sinclair QL

DESPITE NERVOUSNESS throughout the home computer business caused by the financial problems affecting Camputers and Dragondata (see next page) and some slackening in demand for software, the Computer Fair at Earls Court got off to a resounding start on June 14 and was generally regarded as a successful exhibition.

Encouraged, no doubt, by the presence of Susan Hampshire, star of the new TV series *Leaving*, who opened the show, the Press were very much in evidence on the first day with no less than four TV camera crews in attendance. The results of their labours were seen on the Thames TV Database programme and the Channel 4 Earsay programme, among others.

However, apart from Miss Hampshire, undoubted star of the show was the Sinclair QL appearing for the first time in public — and what is more without the add-on ROM which was the source of considerable comment when the early models were delivered.

Now, with the QDOS operating system comfortably accommodated within the casing of the machine and with the four applications packages for word processing, spreadsheet, database management and business graphics, all operational, the QL looks what it is — incredible value for money — a view which was certainly shared by the crowds who thronged the Sinclair stand.

Also attracting favourable comment were the new Commodore 16 and Plus/4 computers which were featured on the Commodore stand. The Plus/4 in particular, with four business programs included in the £249 price of the computer, was being viewed as a possible rival to the Sinclair QL, despite being based on a less powerful processor.

Susan Hampshire not only opened the Computer Fair at Earls Court but also visited the Sinclair stand where she helped promote the Dyslexia Beater cassette reviewed in last month's issue and found time to cast an appreciative eye over the QL computer.

The tendency for home computers to move upmarket into business applications was also apparent on the Acorn stand. There the Z80 add-on processor for the BBC micro attached considerable attention. This enhancement for the BBC computer comes with its own 64K of RAM. Under the CP/M operating system some 55K of this is available for applications programs.

Putting a brave face on their financial problems were Dragondata who under the GEC Dragon marketing banner showed the extended range of Dragon hardware including the Dragon 64 complete with disc drives and the OS-9 operating system which transforms it into a versatile business system.

Also mounting a very professional presence at the Computer Fair were Oric whose Atmos computer is moving upmarket with the addition of a Hitachi disc drive and business-orientated database and spreadsheet software.

Perhaps a sign of developments to come, as European home computing markets begin to catch up with the UK, was the presence of No Man's Land, a French software company providing games software for a range of popular micros but with particular emphasis on the Oric 1/Atmos, now France's most popular home computer.

SORRY

We apologise to our readers and advertisers for late publication of this issue of Your Computer *and for the omission of certain regular features. The cause is a dispute between the National Union of Journalists and Business Press International.*

Oric looks to business

FOR £299 ORIC 1 and Atmos owners can now add a 3 inch disc drive. For £100 they can buy a modem to link up to Prestel, and for a further £250 they can round off their system with an 80 column dot matrix printer.

With these new peripherals Oric Products International claims the Oric has the makings of a viable small business system.

To highlight the Oric's business potential the company has included in the disc pack, database and spreadsheet programs as well as games software. These come together with the disc operating system and a Hitachi drive which uses double-sided, double-density discs to give a capacity of 320K.

The price of the modem also includes the 6K program necessary to convert the Oric or Atmos into a Prestel terminal and to enable them to download software.

Both these products are available now. The dot matrix printer will be released at the end of the summer.

Machine code revealed

FOR THOSE wishing to learn machine code help is at hand in the form of a software package covering four leading micros — the 48K Spectrum, Commodore 64, 32K BBC micro and 32K Atari.

Entitled the Computer Machine Code Tutor, the package is available in two versions — one for the Spectrum which is based on the Z80 microprocessor and the other for the Commodore, BBC and Atari computers all of which are based on the 6502 microprocessor.

Each version of the Tutor comprises two cassettes which load the tutor and then take the user through a series of lessons and exercises. The Spectrum version, which contains over 100K of data on the two cassettes, includes 33 separate lessons, while the 6502 version contains 70K of data and includes 27 lessons.

A simulator routine takes the user through all aspects of the Tutor to give a thorough understanding before starting the lessons.

Both versions come with manuals explaining the instruction codes of the Z80 and 6502 processors respectively. Prices at £14.95, the Tutor has been introduced by New Generation Software.

Joysticks on show

TWO PRODUCTS launched at the Computer Fair by Kempston Micro Electronics were the Pro Joystick Interface for the Sinclair Spectrum and the BBC Pro Joystick.

The main features of the new Spectrum joystick interface are three 9-way D plugs allowing any of the Competition Pro range or standard Atari type joysticks to be connected. Two of these plugs allow compatibility with Sinclair/Psion software (ie simulate keys 1 to 5 and 6 to 0) while the third offers the dual facility of both Kempston Joystick software and Cursor key software.

A further feature is the built in cartridge slot which allows the use of ROM-based software.

The Interface simply plugs into the expansion port of the Spectrum; additionally it can be used in conjunction with ZX Interface 1 and microdrives.

The EBC Pro Joystick is based on the Competition Pro 5000 series which so far has been available only in standard Atari-type format.

The BBC version contains micro switches allowing movement in eight directions together with twin fire buttons for right and left-handed play. The joystick plugs into the analogue port on the BBC and is compatible with a wide range of software.

Prices of the new Kempston products are £19.95 for the Pro Joystick Interface and £16.95 for the BBC Pro Joystick.

Game Lords go for gold

NO DOUBT to keep themselves in appropriately lordly style the Game Lords aka Quicksilva have sold out to the Argus Press Group, publishers of Computing Today and Home Computer Weekly.

Quicksilva will continue to operate from its present location in Southampton and director, Mark Eyles says that the company will continue to trade under its own name as an independent member of the Argus Group.

The take-over by Argus has provided Quicksilva with finance for further development one of the first fruits of which is the formation of QED — Quicksilva Edutainment Dimension — (Sorry about the name) a new division which aims to produce games "with a serious educational content, but presented in a 'fun' way". QED games for Sinclair, Commodore, Atari, Acorn MSX and Enterprise micros are in the pipeline, scheduled for an Autumn launch.

An indication of the way in which the software business is developing is Quicksilva's conclusion of a licensing deal with Atari. First fruits of this deal will be the conversion of the arcade game Battlezone for the Spectrum. Its origins will be clearly credited and rather than ripping off other people's ideas Rod Cousens, managing director of Quicksilva hopes that the agreement with Atari "may establish a trend in seeking licensing approvals in the promotion of authorised versions for . . . home computers".

A VITAL PIECE OF SOFTWARE FOR ATARI 400 OWNERS.

A RUBBER KEYBOARD.

The flat keyboard of the Atari 400 isn't very satisfactory to use.

It simply doesn't put you in touch with the computer in the same way as a push button one.

Our keyboard fits snugly over your present Atari 400 keyboard and does exactly the same job.

Only it does it better.

It makes programming and game playing so much easier because you know instantly which keys you've depressed.

And by raising the keys it raises the standard of your machine.

To set it up all you have to do is to peel off the adhesive backing and stick it on top of your existing keyboard.

And we're sticking a price on it of only £19.95.

So, whichever way you look at it, it's a keyboard that really stands out.

Micro Mouse contest Dibley does it again

THE MICRO MOUSE contest is now an established feature of the Computer Fair and the sight of microprocessor-based mice threading their way more or less purposefully to the centre of a maze is familiar to those with a contemplative side to their nature.

Like coarse fishing, watching micro mice pottering around a maze is not for those with a taste for action.

On the side lines things are different. Mouse builders who have toiled over their electronic marvels during the long winter evenings go quietly bananas as their mice turn in the wrong direction, lose their memory maps or refuse to budge at all.

At this year's British micro-mouse final held at the Earls Court Computer Fair Alan Dibley, doyen of mouse builders, experienced just such a blow when T5, the latest of his stable of mice, having performed well was improved to death by a misplaced screwdriver.

It seemed that the honour of the Dibley team rested on Thezeus, a grizzled veteran from the pre-history of mouse building who plodded resolutely to the centre of the maze in 9 minutes 48 seconds. Hardly a winning time. However, help was at hand in the form of T4 a more recent Dibley development which after one or two false starts zoomed to the centre in 15 seconds.

It was too much (or too little) for Dave Woodfield, Britain's other main mouse builder. His pride and joy, Thumper, having put up a fantastic qualifying time during the morning nosed in a desultory fashion around nosed in a desolutory fashion around the first few metres of maze before quietly giving up. It seems that its batteries were flat.

All depended on Woodfield's other mouse Known Aim, a skeletal creature with the look of a purposeful stick insect. But despite some fast times Known Aim was handled by his maker incurring penalty points which left Dibley's T4 as the outright winner. Alan Dibley thus represents Britain in the Euro-mouse Maze Contest to be held at the Euromicro Conference in Copenhagen.

As winner of the British heats at the Computer Fair, Alan Dibley received an Oric Atmos computer, membership of the Oric Owners Club and a cheque covering his fare to Copenhagen, all of which were generously donated by Oric Products.

The winner in the Novices category of the micro-mouse contest was Bill Urmenyi who is now the proud owner of an Acorn Electron donated by Acorn Computers.

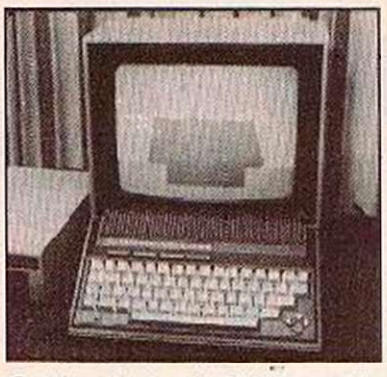
The runners up in both Expert and Novice categories received cheques for £50 from the publishers of *Your Computer* who are also sponsors of the Computer Fair, and those who came third received £30 worth of books donated by Sunshine Publications.

Dave Peachey of Oric in interviewing mode at the Computer Fair: "What's it feel like to win the Micro Mouse competition, Alan?" "I'm over the moon, Dave" which is understandable because Alan Dibley had just won an Oric Atmos computer and membership of the Oric Owners Club together with his fare to Copenhagen where he will represent Britain in the Euromouse finals. The first prize was generously donated by Oric Products.

Quick load routine

RELIEF IS at hand for CBM owners who are tired of waiting an age for cassettes to load in. Software companies are now starting to accompany tapes for the Commodore 64 with a quick load routine which loads in programs up to eight times faster than normal.

The routine precedes the game on tape and works by altering the machine's cassette operating system. Using this technique Thorn-Emi's Turbo Tapes load in a 16K program in under a minute. The company is also offering the same facility on some of its Vic-20 games.



Getting the best of both worlds. The Commodore Plus/4 computer is intended to appeal to home and business users alike. Leaving you to work out which this characteristic picture of Snoopy represents, we would only add that at £249 it seems good value — even if its not exactly peanuts.

16 Plus 4 = 2 new micros

COMMODORE HAS launched two new computers, the 16 and the Plus/4, to sell alongside the Vic-20 and the CBM 64.

Despite the fact that the 16 appears to offer a higher specification for the same price, the company maintains that it will not replace the Vic. Commodore's software manager, Gail Wellington, said that as long as there is a demand for the Vic they will continue to manufacture it.

Both machines contain 32K ROM which includes a new Basic interpreter. Basic 3.5 improves on Commodore's existing version of the language by supplying graphics and sound commands.

They also share the same text and graphics resolution — 40 rows by 25 columns together with 320 by 200 pixels. 15 colours are provided and each can be set to one of eight levels of luminance.

Sound is catered for by two tone generators, one of which can be used to produce white noise.

The two machines are based around Commodore's 7501 chip. This combines the 6509 processor — a version of the 6502 — with the Vic display chip. For machine code programmers there is a built-in Monitor with 12 commands.

The Commodore 16 will sell for £129.99 in a starter pack comprising the computer, a cassette unit, Introduction to Basic Part 1 and four games tapes. It offers 16K RAM and 12K is available to the user.

The Commodore Plus/4 costs £249 and is intended to appeal to home and business users alike. It comes with 64K RAM and four QL-style software packages, a spreadsheet, a wordprocessor, a database and a business graphics program.

Unlike on the QL these four programs are stored in a further 32K ROM, and are available at the touch of a function key. Each can exchange information with the others, while a screen window facility allows the user to view two packages at the same time.

Double trouble

THE NEWS THAT two home computer manufacturers — Computers and Dragondata — have experienced severe financial difficulties has sent a tremor through the micro business.

Computers, manufacturers of the Lynx home computer and the recently announced Laureate business system has been looking for additional sources of finance for some time and it now appears that it has reached the end of the road with liquidation as the most likely outcome.

In the case of Dragondata the situation appears slightly more hopeful. Having gone into voluntary receivership a buyer for the whole company is being sought. At present Dragondata has a marketing agreement with GEC which is continuing pending the possible emergence of a new owner to carry on the business.

Paradoxically, news of the problems encountered by these companies comes after a very buoyant period in the home computing market. Figures released by AGB Home Audit, a market research company, reveal that home computer sales in the UK rose by 75 per cent. in the first quarter of 1984 compared with 1983. This represents sales of 200,000 home computers in the first quarter of the current year as against 114,000 for the same period last year.

HISOFT PASCAL DEVPAC

Quality ZX SPECTRUM* Software

HISOFT PASCAL 4T

"... I haven't seen any other compiler that could match Hisoft's Pascal" ... *Using the Spectrum Micro — Autumn 1983*
"This is a very impressive product . . . of benefit to any Spectrum programmer . . ." *David Bolton ZX COMPUTING Aug/Sept 1983*
Just two comments from full length reviews of our powerful and virtually full implementation of Standard Pascal. The advantages of using Pascal are well-known — fast, self-documenting, and above all, structured programs and now, with Hisoft Pascal, you can reap all these benefits on a wide range of home computers, including the 48K Sinclair Spectrum.
Hisoft Pascal produces programs that run typically 40 times faster than equivalent ZX BASIC programs and, sometimes, up to 1,000 times faster!
Hisoft Pascal supports FOR . . . DO, WHILE . . . UNTIL, CASE . . . OF, INTEGERs, REALs, CHARacters, RECORDs, POINTERs, SETs, ARRAYs etc. etc. — it is not a Tiny Pascal but a virtually full implementation of the language allowing the user to develop true high-level language skills while attaining execution speed close to that of machine code. Complete with a 70-page manual.
Hisoft Pascal is also available in a variety of disk formats, including sequential FILE handling.

HISOFT DEVPAC 3

"... DEVPAC is most highly recommended. The documentation is first class." *Your Computer May 1983*
"... if you write programs in machine code, buy DEVPAC — it is the best currently on the market." *Adam Denning, ZX SOFT in Which Micro September 1983*
Two comments from reviews of earlier versions of DEVPAC — **now** we have DEVPAC 3 available: a powerful Z80 assembler with conditional assembly, assembly from tape (to enable generation of very large code files), ORG, EQU, DEFB, DEFS, DEFW, DEFM, labels of any length — in fact all you need for fast (3,000 line per minute) and powerful assembly programming. But it doesn't stop there: DEVPAC 3 also includes an incredible debugger/dis-assembler giving you a 'front panel' display of the Z80 system and allowing extensive debugging of your machine-code program, including single-stepping programs **EVEN IN ROM!!** Open up the secrets of low-level programming with DEVPAC 3.

Prices:
Hisoft Pascal 4T (ZX SPECTRUM) £25 inclusive
(NewBrain, SHARP MZ700 etc) £35 plus VAT
Hisoft Pascal 4D many disk formats £46 inc.
Hisoft DEVPAC 3 (ZX SPECTRUM) £14 inclusive
(NewBrain) £25 inclusive
STOP PRESS Hisoft Pascal for the SPECTRUM now comes complete with a Turtle Graphics package allowing fast and easy production of complex graphic displays.
Hisoft Pascal and Hisoft Devpac also available on ZX Microdrive please write for details

HIRE SPECTRUM SOFTWARE

CHOOSE FROM OUR VAST RANGE
FREE 26 page CATALOGUE with full details of our range of over 280 different programs for the ZX SPECTRUM. All hired with the consent of the publishers. Whether you prefer to ZAP aliens, get lost in an ADVENTURE game, EDUCATE your children, CALCULATE the family finances or COMPILE machine code programs WE HAVE THE RIGHT TAPES FOR YOU TO HIRE.

FAST SERVICE
We stock up to 60 manufacturers' original copies of each tape (over 3000 tapes in stock), and can normally despatch your tapes the day we receive your order, and we always use first class post.

LOWEST PRICES
We believe our prices are the lowest of any library, yet we offer the LARGEST range of titles. Hire up to 3 tapes at a time, for 2 weeks, for only £1.07 each (inc VAT & p&p).

FREE TAPE HIRE
For a limited period we will send your first tape (your choice) FREE, so join our library now. You can't afford NOT to! If you've tried another library and are wary of our claims send a stamp and we'll gladly send you a copy of our catalogue - we're confident you'll join when you see it!

NATIONAL SOFTWARE LIBRARY
200 Mulgrave Road,
Cheam, Surrey SM2 6JT

I enclose cheque for £6.00 for LIFE MEMBERSHIP and I understand that my first tape hire will be FREE. If, within 28 days, I'm not delighted with your service you'll refund my membership fee.

BEGINNERS first bytes

Starting out in home computing? First Bytes is for you. Just write to *Your Computer* with any hardware or software problems, no matter how small or simple.

I could do that...

This month's problem is an old favourite. Write a program to print out all the prime numbers below 1000. There are a number of ways of tackling this problem. We are looking for the program that does the job in the fastest time. In awarding the £15 prize we will make allowances for speed differences between Basics.

Getting started on machine code

"I've been using a computer for some time now, and I know Basic pretty well. Now I want to start programming in machine-code, but the trouble is that I don't know where to start. I wonder if you could help me?"

BEFORE YOU CAN start writing machine-code programs you have to find out which machine language — machine-code — your computer uses. This depends on the processor inside, and so the first thing to find out is which processor you've got.

There are many microprocessors, but only a handful of these are used as the heart of home computers. The most common one is probably the Z-80, as it is this that makes the Spectrum tick as well as the Lynx and many other more expensive computers. The next most widely used is the 6502, used in the BBC, Electron, Apple and all the Atari home computers. A modified version of it is the 6510, used in the Commodore 64. Other processors in home computers include Texas Instruments' TI9908 — used in the TI99/4A — and Motorola's 6809 — used in Dragons — and 68008 — used in the new, low profile, QLs.

So, before you go any further, find out what processor you are using — this will tell you what machine language to learn.

Unfortunately it isn't quite as simple as finding out the processor you've got and then learning the language to fit it. An awful lot depends on how the memory of the computer is arranged and accessed by the chip, and also on the special facilities your micro has got.

These might include dedicated processors to look after the graphics or sound — the 64 has both, in the 6566/9 video chip and the dedicated 6581 SID chip — sound interface device — or unusual ways of accessing memory, particularly if there is more memory than can be seen in one go by the chip.

So, the next step is to find out how the memory of your micro is arranged. This is best seen with a memory map, which is a schematic picture of what the memory looks like. There is usually some kind of map in the user manual, though the best ones are often to be found in the technical manuals or books about your micro.

The best memory maps tell you not only what the memory looks like, but how the processor uses it too. They should list what the specific locations in memory do, or at least those that are important. It is particularly useful for example to be able to know where the start of the Basic program is, or where a pointer to it can be found, as well as knowing where the colours are stored or what their values are.

A good memory map can also be very helpful to your Basic programming, as you can then use efficient Pokes to put variables or numbers exactly where you want them. You can also use the information to help you protect your programs from theft by hiding pointers and replacing them later.

Sadly, even if you have a complete memory map and you know the machine language that you want to use, you are still a long way from knowing how to program your micro in machine-code.

The main obstacle facing you now is that of getting the machine-code into the machine. The ease with which you can do this is entirely dependant on the micro you are using. The most helpful ones, like the BBC, have been designed to allow you to do this very simply, even to the extent of being able to write machine code programs from within Basic.

Micros like the BBC have a built in assembler. What an assembler does can be understood best by looking at what happens to any program that you type in in Basic.

What happens is that as you type it in it gets stored in the computer's memory, and when you come to type Run the processor looks at each instruction and interprets it. With machine-code programs it is slightly different — when running these the processor looks at the individual bytes, and so individual bytes or

(continued on page 41)

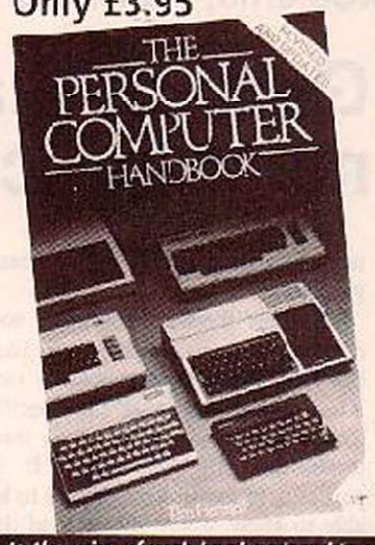
THE PERSONAL COMPUTER HANDBOOK

TIM HARTNELL

The complete guide to selecting and using small computers, including an explanation of how they work and what they can do for you, a detailed analysis of the available systems on the market and how to buy them, and how to get the most from your computer with an extended step-by-step guide to programming.

Only £3.95



SPECTRUM MACHINE CODE

STEVE WEBB

BASIC has it's limitations. Machine Code programmes are written in the Spectrum's own language, facilitating access to the most sophisticated programming and stretching both the ZX SPECTRUM and it's user to new horizons in computer programming. This book fully explains what Machine Code is and how it works, before exploring the incredible versatility of the ZX SPECTRUM.

Only £3.95

We use only 10% of our mental potential

These are the words of Albert Einstein, the greatest physicist of recent times. L. Ron Hubbard's discoveries in the field of the mind prove today that Einstein was right!

In his book **DIANETICS® The Modern Science of Mental Health**, L.Ron Hubbard takes one more giant step in this direction. He demonstrates how anyone can use his discoveries to get rid of the barriers that have so far prevented him from using his mental potentials fully.

More and more people from all walks of life including technicians, artists, G.P.s, scientists, workers and managers alike, use DIANETICS technology today. And the thousands of written reports on their success are the best proof for the quality of this book. Get your own copy today.

BUY AND READ DIANETICS by L. Ron Hubbard.
Ask for it in your local bookshop, or send directly £3.95 to:

DIANETICS Dept C., Freepost,
St Hill Manor, East Grinsted, Sussex RH19 4ZB

Your copy of this 470 page book will be sent by return post.

DIANETICS is a registered name

(continued from page 39)

pairs of bytes are what you have to put into the memory.

Without any software assistance you can simply Poke the information into memory, but this does require you to be working at bit level. On some machines — notably the Spectrum — this is not too difficult, once you get used to it, but compared to writing Basic programs it is very slow.

An assembler allows you to use semi-helpful words as instructions — mnemonics — although you are still working at byte level. For example the instruction

LDA,8

The machine-code instruction above would be turned by an assembler into two bytes, the first of which would contain an instruction to load the second byte (8) into the register A. In true machine-code this would be just 16 bits, or one hexadecimal number — as you can see it is much easier to use an assembler.

Most assemblers are simply a piece of translation software, and can take a lot of getting used to — it is best to buy carefully here, though if you have a BBC you can use the built in assembler.

So, to start using machine-code you need to know which processor your machine uses, all about the memory of your micro, and either the pure machine language or an assembler for it. This takes time, but the results, as you've probably seen from the best games around, can be superb. It is worth the effort, but be prepared for a struggle.

Getting machine-code programs typed in is only about half of the battle. As you know from Basic programs debugging takes up nearly as much time as programming. But how can you debug single bits, which is usually where the mistakes are? One way is to Peek the locations, and check the results with what you expected.

A software tool that helps you do this is the machine-code monitor, which lets you look at the memory, and if it's a good one, it also lets you trace through your programs step by step, and look at or change the registers at the same time.

If you are serious about getting into machine-code then I would recommend that you get a book specifically for this purpose, and for your machine. Books on machine code are usually a lot more helpful than the manuals, and are worth the investment — after all most of them are no more expensive than a piece of software.

BEGINNERS first bytes

Choosing a printer

A PRINTER IS the first big purchase a new computer owner is likely to consider. Large numbers of all kinds of printers are being bought by home computer users, and the combination of competition and high sales has brought prices down over the past few years.

More people than ever before can now seriously think about buying a printer. This is marvellous, but the variety of the choice does bring confusion. Instead of being limited to the little — lamented, or little-lamented? — Sinclair ZX printer, Spectrum owners can now hook up thermal, multiple pen, dot matrix, daisywheel, or combined typewriter/printers to their machines.

What are the pros and cons of the various types? Which will best suit me? What are the questions I need to ask myself to reach a sensible conclusion? First, a summary of the differences between the types of printers.

1. Thermal printers: The Sinclair ZX printer works by using a spark to burn through the aluminium film on the special paper rolls. Other makes use a special heat-sensitive paper. The ZX printer can be used on many other popular micros using adaptors costing below £30.

If you want program listings and screen dumps, and already have a ZX printer, you could use it with one of these adaptors on your new micro. While this printer could not be described as reliable by the most loyal Sinclair user, Alphacom thermal printers give a much better print quality, and they are reliable.

The Alphacom 32 is made for Sinclair machines — with adaptors to hang it on to other machines — and the Alphacom 42 is available for most popular micros. They give either blue or black print on 11cm wide paper. Printing speed is also appreciably better than the ZX. A new 80 column version is coming.

2. Dot matrix printers: Pins hit an inked ribbon making patterns of dots on plain paper. Normal text is printed very fast, and programs are available for most micro/printer combinations to print copies of screen displays — but slowly!

For many purposes, they are ideal. Program lists, work-sheets for teachers, letters, draft articles for computer magazines, the list of application is huge — that is why this group of printers dominates the market.

If you are willing to pay between £200 and £300, you enter the range of high quality dot-matrix printers like the Mannesmann Tally Spirit 80. These printers will be faster and more flexible, more special — italics, enlarged, condensed, super- and subscript characters, etc. I know several businesses that use them for invoices and letters.

3. Daisywheel printers: They use interchangeable discs containing the preformed character set, the ones used on modern electronic typewriters. Print quality is really first class, and by changing the wheels you can switch between three sizes of print, and between character types, in the same document.

But printing speed is slow. Falling prices bring the Juki and Daisystep machines within the reach of many home micro users. However, think hard before buying one. Do you really need that quality? In the shop the printing speed may seem alright, but wait until you need to list a big program, or print the draft of a four-page document!

Remember that the brochure's 20cps may turn out to be closer to 10 (Trades Description Act — where are you?). If you can afford a simple dot matrix (or an Alphacom) as well, then go ahead.

4. Multiple pen, Ink dot printers: Don't think I am dismissing them. The option of producing a multi-colour print-out is amazing. In the not too distant future, they will form a much bigger part of the market. But right now, multi pen plotters are too slow, and ink jet printers not reliable enough to be generally recommended.

5. Combined typewriter/computer printers: At first sight, these seem to be an obvious choice. A real electronic typewriter, doubling up as a printer for your listings. Marvellous! Or is it? The slow speed makes it a very poor choice for listing programs, and bashing out rough drafts.

Also, if you have a reasonable word processing program for your micro, you will find it hard to go back to an ordinary typewriter, and you could have bought a white elephant. Of course, there are circumstances when this option will make very good sense. Does someone else in your home really need a typewriter?

You would sometimes appreciate the superb print quality of a daisy-wheel. The extra cost of the interface will then be money well spent.

- Under £100. You will find it hard to beat the Alphacoms for a balance of price and quality, with a good printing speed.
- £100-£200. There is a gap here. The new 80 column Alphacom or the Brother HR5 may fill it. There are lower price dots in this range, but think hard about the benefits of those in the next group. Will it be worth waiting until you have saved the extra cost?
- £200-£350. You will find here some good quality printers, like the Epson RX80 and the Mannesmann Tally Spring 80, giving flexibility and high printing speed. The Daisystep daisy-wheel is in this range, if you can tolerate the slow printing speed.
- £350 and upwards. In this range you begin to meet printers designed to flourish in the 9 to 5, five days a week, week in, week out world of commerce. Are you sure you need this rugged construction? But then, most people don't need Quads, Nikons or Porsches — they're not essential, but very nice if you can afford them!

Whatever choice you make, even if it's only the little ZX wonder, this is certain: Once you plug a printer on to your micro, your computing enters a wonderful new dimension, and you'll wonder how you managed before you bought it.

The Key to Spectrum Machine Code Success.

Picturesque's MACHINE CODE SYSTEM is used and recommended by professional software writers, yet the excellent documentation and the friendly, easy-to-use programs have been highly recommended for beginners.

You will only buy one Machine Code System, so buy the best, the one the professionals use.

NEW IMPROVED PROGRAMS — MICRODRIVE COMPATIBLE

ASSEMBLER

Completely self-contained with its own line editor, giving an easy-to-read 40 column tabulated listing. Auto line numbering, line renumbering and auto tabulation make this one of the fastest and easiest Assemblers to use. 5-character label names. Decimal, Hex or ASCII constants. SAVE/LOAD/VERIFY both the listing and Machine Code to cassette/MICRODRIVE/NETWORK. Assemble from cassette or Microdrive into memory for very large programs. Customise to most Centronics printer interfaces, or RS232 (with Interface 1) for 80 column printout. FAST ASSEMBLY — 1k of code in 7 seconds. Assembler Directives:— ORG, END, DEFB, DEFW, DEFM, EQU, DEFL. (Microdrive and Centronics facilities only operate with 48K machines.)

£8.50
INCL. VAT & P&P.

MONITOR

The ideal tool to help the beginner get started, yet it contains all the commands for the experienced programmer to run and de-bug machine code programs. Inspect and alter memory contents in Hex or ASCII. Breakpoints and full Register display. NOW WITH SINGLE STEPPING through RAM or ROM. Disassemble any part of memory, RAM or ROM. Dec-Hex-Dec number converter. Printer output to ZX printer or via RS232 (with Interface 1) or customise to most Centronics printer interfaces. General memory management commands include Hex dump, Insert, Delete, Fill and Move. Can reside in memory with the Assembler (48K machines only) to give a complete Machine Code programming system.

£7.50
INCL. VAT & P&P.

Programs supplied on cassette with option to save onto Microdrive cartridge not supplied.

Existing owners can obtain the new programs by returning the **cassette only** to Picturesque, along with a cheque/P.O. for **£1.50 per program** (inc. VAT & P&P). New cassettes will be supplied by return of post.

Available from the "SPECTRUM" chain of stores, branches of John Menzies and all good computer shops, or by mail order by sending cheque/PO to:
PICTURESQUE, 6 Corkscrew Hill, West Wickham, Kent, BR4 9BB. Send SAE for details.

Local news

Tamworth

Taking its name from the Tamworth Voluntary Activities Centre, Ludgate Street, Tamworth, Staffordshire, the Tame Computer Club meets on the first and third Friday of each month. All types of machine from home-made to professional business systems are welcome. For further details contact Tony Beckett on Tamworth 53473 or Alan Wiseman on Tamworth 69537 — after 7.00 pm.

Walsall

Every second and fourth Monday of the month — the Walsall Computer Club meets at Park Hall Community School, Park Hall Road, Walsall, Staffordshire. For more details contact Walsall 23875.

Wolverhampton

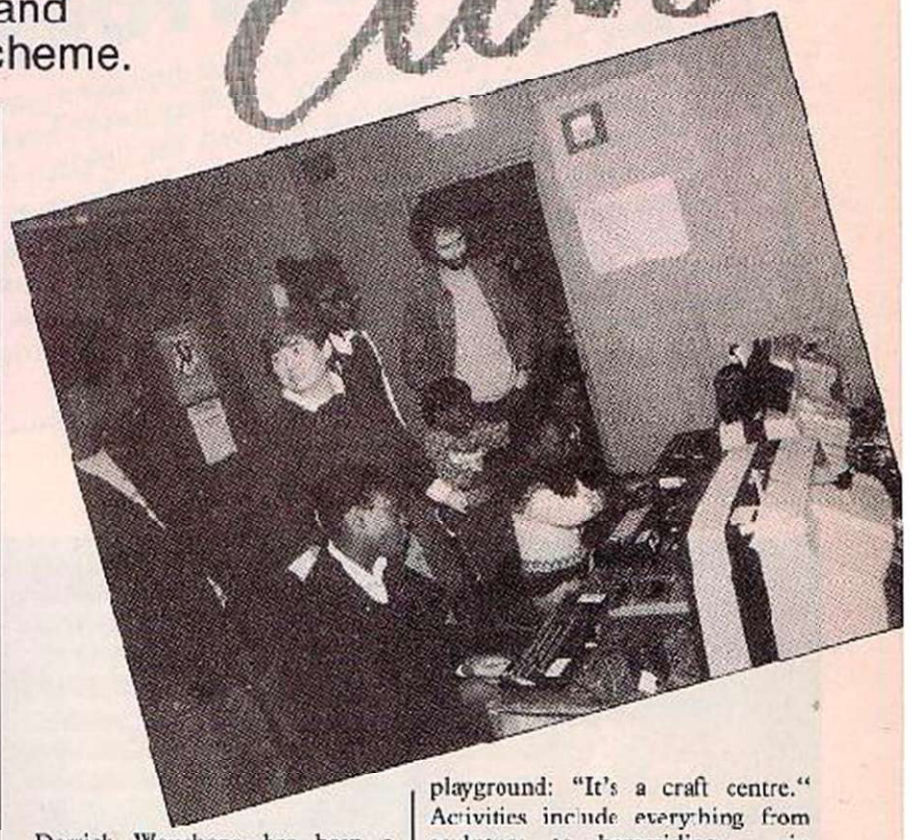
Despite being called the West Midland Sinclair Users Group, people with CBM-64s or Aces are welcome to the weekly meetings at Ounsdale School, Wombourne, near Wolverhampton. For more details contact Graham Walden, WMSUG, 80 Planks Lane, Wombourne, West Midlands.

Coventry

The Coventry & Warwickshire Commodore Computer Club is one of the Midlands' most lively user groups. It meets on the fourth Wednesday of each month except August and December at Stoke Park School and Community College, Dane Road, Coventry. For more details phone regional ICPUG on 0203-413511.

COMPUTER *club*

Paul Bond discovers a novel idea to help kids get hands-on experience of micros — the Hammersmith and Fulham Playbus Scheme.



THE HAMMERSMITH and Fulham Playbus Scheme may not sound like a computer club to you — and to some extent you would be right. But as part of its important function of making various recreational and educational resources available to a community that might not otherwise even get to know about them, let alone use them, the project has started carting computers round to various youth centres in order that kids get some hands-on experience.

But don't they have this sort of thing in schools? Ian Miller, whose brainchild this is, maintains not — at least not with the Sinclair ZX Spectrums which are the group's staple micro at the moment.

"There are very few ZX Spectrums in London schools, or BBCs for that matter," he says. "The problem is not grants, particularly, but that Inner London Education Authority maintenance people will only deal with Research Machines." Teachers new to micros are shy of taking on something without ILEA backing, it would seem. Nevertheless, ILEA did cough up enough to buy two of the group's four Spectrums.

"We chose this machine because it was the best thing around at the time. We wanted to prove it could withstand rough treatment — being shoved in vans and moved from place to place, plus being pounded by kids."

But before you can teach the children, you have to teach the teachers, so Ian Miller is taking his micros round to various youth centres and playschemes: first, to see who they are accepted, and secondly, to create enough knowhow in the playleaders so they can oversee computer activities on their own.

Derrick Wauchope has been a playleader "for years and years" — he started when at school and has been doing it full-time for four years. Grappling with a game of Voice Chess — using the Currah speech synthesiser — was less of a problem for him, though, both because he is a keen chess player and because he studied business computing while at college.

Wendy Copeland — a playleader for eight years — was a little less successful with her first stab at the Hobbit adventure game, completing 2.5 per cent and being devoured by a hideous troll. Such are the hazards of community work.

Peggy, who very quickly became *au fait* with hooking and unhooking all the various computer leads, pointed out that Coningham Road was more than just an adventure playground: "It's a craft centre." Activities include everything from sculpture to horseriding — in Finsbury Park. They try and organise three or four holidays a year for the children, together with day-trips and outings to sports events. There is a lot of interest in musical activities "but it's all sound systems and electronic instruments. Teaching guitar is pretty dated".

At one youth centre, the Playbus organiser had already had a great deal of success in getting kids who were already computer-orientated to do more in the way of graphics and speech synthesis programming. He was also working on ways of using the TasWord system to give unemployed people some experience of word processing. "I could really do with some contact and help from local computer clubs, though. There don't really seem to be any in West London. I was approached by a group of community workers who wanted to know how to use a Commodore for office work. I'm snowed under with these kinds of requests for help."

Future aims include specific projects like working on graphics programming and using Logo — hopefully with a real Turtle. "Logo is useful for learning about graphics and programming by the back door, without realising that they're doing it. It's good for handicapped kids — teaches the about direction and length and space." Hammersmith and Fulham Playbus Association can be contacted at Project Enterprise, 16 Askew Crescent, London W12 9DP. Telephone 01-740 7271.

DON'T JUST SIT THERE - PLAY SOMETHING!

FORBIDDEN FOREST

Forbidden Forest is more of a quest than just a game! The action takes place in a four dimensional scrolling forest landscape which many have entered, but none has returned. Yes, I did say FOUR dimensional! day fades into night as the action unfolds! The quest is to seek out and destroy the Demogorgon, mystic ruler of the Forbidden Forest. Before you can even set eyes on him you will have to contend with his army of fearsome creatures, including mutant spiders, showers of giant frogs, snakes, dragons, skeleton soldiers and more! You have only your trusty bow and arrows to depend on!

SS018

AZTEC CHALLENGE

A challenge on an epic scale! Aztec Challenge takes you on a journey to Mexico and the ancient pyramid of Tenochtitlan. The ancient Aztec gods and their devotees have ensured that no ordinary human can learn the secrets of the temple and live to tell the tale. The pyramid is protected by all manner of treacherous traps and hidden perils - an epic test of your courage and cunning. Aztec Challenge features no less than seven totally different screens - here are just three of them - each of which presents a brand new challenge. We hope your joystick can stand up to it!

SS019

SLINKY

Slinky, the spring, was having fun hopping about when suddenly he came upon a pile of coloured blocks, so he thought he'd play around on them for a while. Much to his amazement he found that they changed colour when he landed on them. Wow! But unknown to him, the blocks belonged to the Wicked Wizard, who sent his friends along to tease our poor hero. Slinky is a real fun package with ninety-nine levels, amazing reward displays, and action replays. Where else could you meet such charming characters as Dusty the dust cloud, Marge the magnet, Ralph the random raindrop, and Lorenzo the chameleon hopper?

Tank Commander

Vic-20 + 8K
Strategic Action
£5.95
Creative Sparks

★ ★ ★

Puts you in the driving seat of a tank. Screen display shows an overhead view of your manoeuvres as you drive into enemy territory and blow up the enemy fuel dumps. Under continual attack from tanks and aircraft, each round is of increasing difficulty. It's like Eastern Front insofar as the terrain scrolls, but it's a lot less intellectual. So if you must drive around shooting at things, why not play this game instead?

Red Meanies

Dragon 32
Eat-'em up
£6.50
Salamander

★ ★ ★

A kind of three-dimensional Pac-Man with cheese instead of power pills. If you eat any green cheese as you perambulate around the maze, this turns the red meanies blue and renders them edible. Strangely enough, they tend to jump down your throat in this state; meanwhile another red meanie is released into the maze. Useful display shows how many meanies and lives are left. Nice idea, shame about the graphics.

Stock Car

BBC B
Car race
£7.50
Micro Power Ltd

★ ★ ★ ★

I have been waiting for the ultimate car race — this is near to it. A one or two player game which requires a certain amount of learning and skill leaving the player weary and hot! A tip: if you have BBC joysticks, use the keyboard!

Encounter

☐ *CBM-64*
☐ *£7.50*

★ ★ ★

OUT FOR A SPIN in the old laser tank you cruise through an alien landscape in which the green grass and blue sky are interrupted by a network of tall black cylindrical structures which look like the sort of architecture that Prince Charles would probably complain about.

Sooner or later the locals turn out to cause trouble but, unlike housing estates, here they do not have Harringtons and crewcuts, rather they bear a strong resemblance to flying saucers.

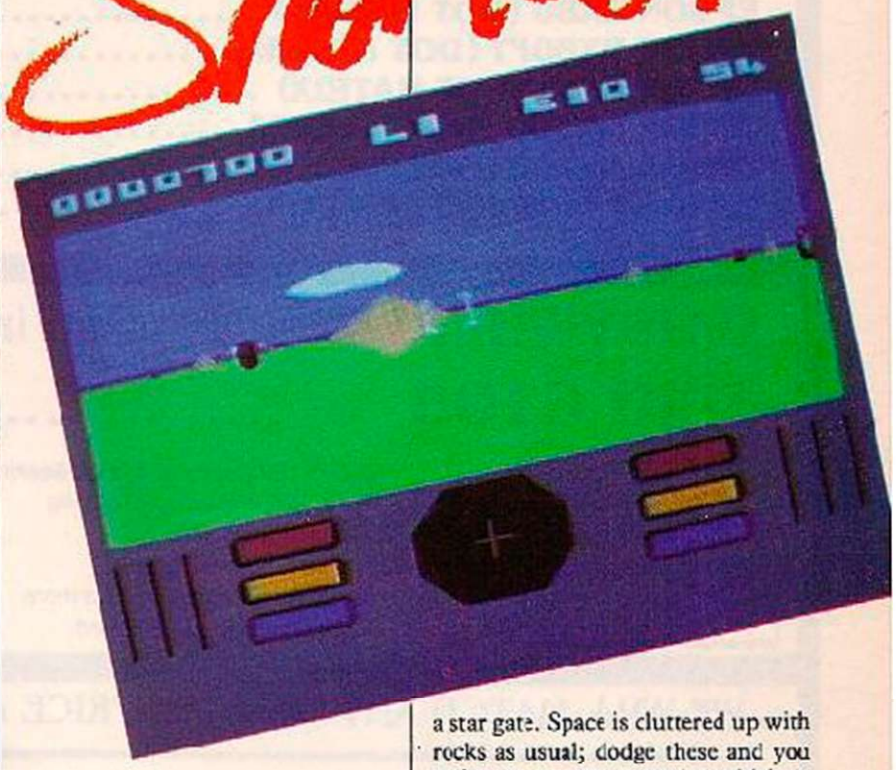
Encounter is similar to games of the 3-D tanks genre, except that your assailants are not armoured vehicles with tracks. Sensation of speed and manoeuvrability as you charge through the maze of mysterious black cylinders is very strong. At the bottom right-hand side of the screen is a display giving a plan view of hostile forces around you.

Using the joystick you swivel around until you have visual contact with one of the blighters, usually a small blob skimming over the plain near the distant mountains.

They zoom towards you and will cause you a certain amount of damage if you fail to destroy them before they hit you; they start shooting at you. If you do hit them they disintegrate in a haze of triangles. Homing missiles appear periodically: the warning panel flashes red and the best tactic is to reverse away from them while firing. They never miss unless destroyed. Try not to back into a pillar.

Once you have eradicated all the malcontents from the forest of cylinders you are catapulted through a star gate. Space is cluttered up with rocks as usual; dodge these and you arrive at a new scenario, which is basically the first one in different colours.

Little touches like the warning siren that goes off as the homing missiles approach add a new dimension of interest to this game. I found it addictive; a pity that the scenery is so boring. An unusual place to visit, but I wouldn't want to live there.



Carnival Massacre

☐ *Atari*
☐ *£15.00*
☐ *Creative Sparks*

★ ★ ★

"FUN TURNS TO FEAR" proclaims the Friday the 13th style cover which shows a couple of disturbed adolescents hurtling off a fairground switchback. Butcher Bill and Ruthless Rick are out to turn all the cries of pleasure to cries of blood-curdling terror, we are told. Slipping quickly into Mary Whitehouse mode, I get ready to lay waste yet another evil threat to the tender minds of the nation's youth.

In fact, it is all pretty twee. "When you are in love, it's the most wonderful night of the year" burbles away relentlessly in the background as the pretty fairground Ferris wheels spin on-screen. Every so often someone falls off and you have to catch them. Bill specialises in missiles on the wheels while Rick plants bombs on the roller coaster. When you have saved everybody you grab your gun and shoot the egregious pair as they cruise overhead in the sky-lift.

This is a game that plays on the frustration side of your reflexes, rather than the aggression. It's much harder to save things than it is to blast away at them. But you can work all that tension off when you consign Rick and Bill to oblivion. You have to have saved at least six passengers to be able to do this.

A gun appears at the side of the screen — fetch this and an egg-timer appears to register how much time is left for you to gain bonus points for shooting Bill down from the Ferris wheel. The same applies to toppling Rick from the roller coaster. Attractive graphics and not as grisly as it is painted on the cartridge cover.

Bath Time

★ ★ ★

BATH TIME IS PART of a new wave of "wet" computer games designed to clean up the software market, rather than just clean up money. Along with Dinky-Doo and the Snowman, they form part of a thoroughly soppy development in computer games, which the staff of *Your Computer*, thoroughbred pacifists and bath-takers to a person, can only applaud.

Frenzy

BBC B
Novelty
£7.50
Micro Power Ltd

★ ★ ★

This game is indeed a novelty and also fairly difficult in its later stages and higher scores. The only description I can think of is that it is similar to the "Painter" type of game. If you like those, try it.

Tube Way Army

Dragon 32
Shoot-'em up
£6.50
Crystal

★ ★ ★

Nothing to do with Gary Numan — this is a rather uninspired Defender. You fly across a landscape bombing and rocketing fuel dumps, and there is a cavern. I found the game frustrating rather than challenging, and in joystick mode, the only way I could drop bombs and keep manoeuvring was to bash the spacebar with the joystick. The response to controls is very slow. Nevertheless, this is not too bad an effort when you consider the game is implemented on a Dragon.

Mission XK1

Dragon 32
Shoot-'em up
£6.95
J Morrison Micros

★ ★

Drop from the mothership and dodge the deadly asteroics to siphon up Zyphoneum from the planet Zyphon to keep you and your buddies in orbit. Landing pads are different sizes — the smaller the pad, the bigger the score. an excellent rendition of Richard Strauss's Also Sprach Zarathustra, but really only worth playing on excessively boring trips out to Clavius Base.

(continued from page 45)

Ecological stabilisation would seem to be the underlying theme of this game. The aim is to keep a fish and a swan alive in the bath. Not one of your old zinc jobs but a large Graeco-Roman effort with sluices operated by angles with wings and halos. Combined with the pacifying funereal music and the pastel colours the game creates a general air of tedium that makes you realise why Satan got so fed up sitting around on clouds knocking back the ambrosia and exploring new chord progressions on the harp that he decided to form his own chapter.

If the water level in the bath gets too high the swan will swim away; if it gets too low the fish dies. In this game you do not seek to contend against the empire but only to harmonise various natural forces — the elephant who drinks the water and the little boy who pours bucketfuls of water in at inopportune moments. You have to stolidly maintain the water level listening to more of the kind of music that makes Vangelis sound like a rock musician.

Peaceful harmonies and good graphics — but lacking the kind of addictive quality that games like Chinese Juggler can build up. That is a game about maintaining balance par excellence. It also has some kind of progression in it providing incentive. Non-violence is great, but not when it's merely allied to maintaining the status quo.

So full marks to PSS for not trotting out another space game as sequel to their excellent — but violent — Blade Alley for the Spectrum; however, there must be more to life than this.

Buzzard Bait

☐ *Dragon*
☐ *Microdeal*
☐ *£7.95*

★ ★ ★

THE GAME WITH added software protection in the form of a dongle. A dongle, for the uninitiated, is a hardware fix — a gadget that plugs in to the machine without which your program will not load or run properly. You have to pay a little bit extra for the privilege of not being able to break into the program, although you can make back-up copies. You just need to use the same dongle to run them.

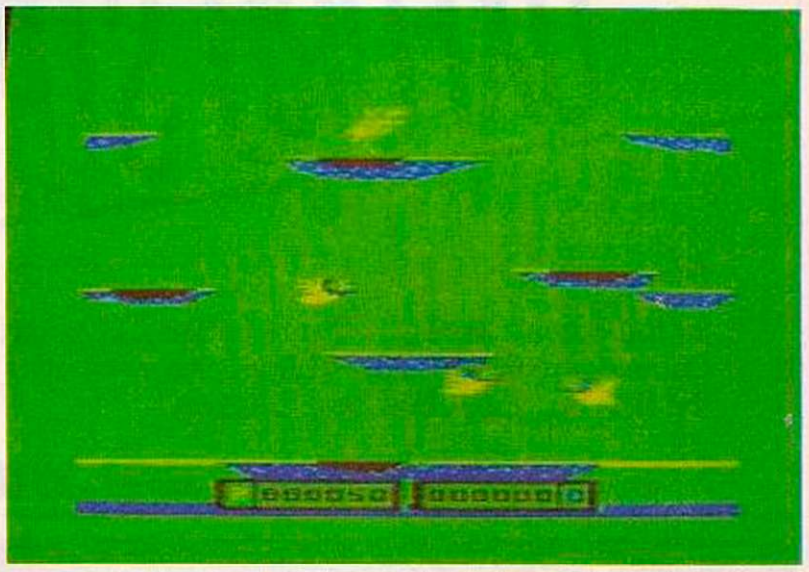
Having said all this, is Buzzard Bait worth protecting? It seems a little strange to have gone to all this trouble just to protect a game on a machine whose graphics capacity is not exactly stunning. Microdeal say they are test-marketing the concept and want to see how Buzzard Bait's sales fluctuate from the norm of a new Dragon game.

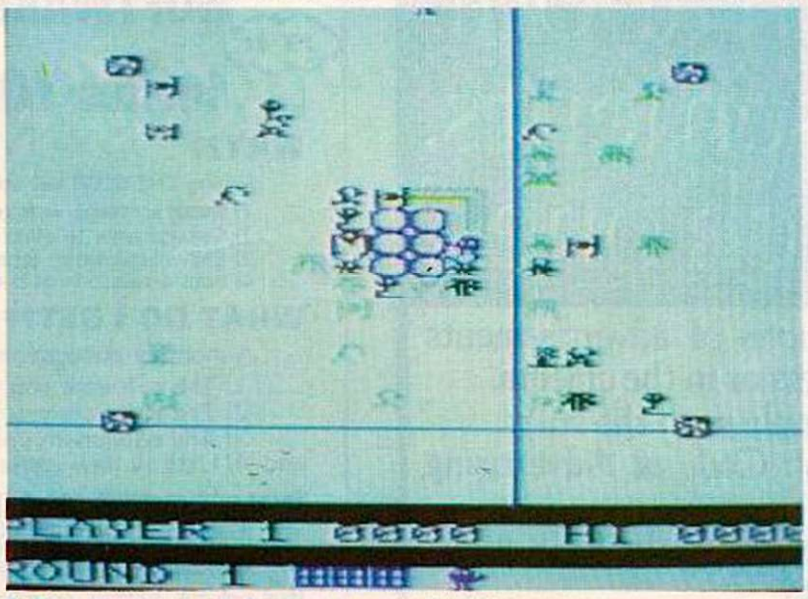
Exactly how you predict average sales of a computer game is a mystery to me — these things are conditional on release timing, what other software is about and what other machines are about. The fact that Dragon Data who make this home computer have recently admitted severe financial difficulties shows how quickly the microcomputer market can change.

The graphics are well-implemented showing a skyborne joust between riders on an overgrown buzzard. The game also has a one-player option. Both players are flying at the same time — birds can be distinguished by their different colours. The object of the game is to destroy all the white birds by keeping your lance above that of the enemy and flying into him. If your lance is lower then you have a long fall; if both lances are level neither rider is dismounted.

The screen displays clustered "land-masses" which hover in the air and which you can bounce around on. As the same goes on these start to disintegrate creating more room for manoeuvre. To get the bird to flap its wings you press the fire button on the joystick.

After a certain amount of time has been spent fighting a single wave, a pterodactyl appears on the screen. A mere touch from this creative spells death. If a player is knocked from his mount, the empty bird flies off the screen and — if you have a life left — player and bird rematerialise on one of the four white phasing pads.





Mutant Herd

☐ *Vic-20*
☐ *£8.00*
☐ *Creative Sparks*

★ ★ ★

THIS CARTRIDGE game for the Vic-20 puts you in the shoes of a ruthless mutant slayer determined to keep the plutonium-crazed mutants out of the powerhouse. You manipulate two laser barriers to keep them out and use the same two barriers to guide your character to the mouth of the mutants' burrow.

Once you succeed in pushing the little man down one of the holes you get a second screen showing a side view of a mine with a vertical shaft on the left and a number of horizontal tunnels running off it. You have to pick up a bomb from the top, place it in the bottom tunnel where there are a number of eggs guarded by a giant ant then run back to the top and detonate the bomb by pushing a plunger without being eaten alive.

The crystal ball

Duckworths latest book is entitled *The Adventurer's Companion*, a guide to solving four popular adventures — The Hobbit, Colossal Cave and Scott Adams' Adventureland and Pirate Adventures.

Dragon owners are well catered for. Dungeon Software have Temple of Zoren and The Crystal Chalice of Quoron for the older adventurer and Giant's Castle for 7-11 year olds.

A helping hand

Scott Graham of Lchmaben is having a few problems with Colossal Cave while Craig Williams of Staines is finding Voodoo Castle a little tricky.

Colossal Cave

—Can't open the clam?
TNEDIRT A DEEN UOY

—Dwarf a problem?
MIH TA TI WORHT DNA EXA SIH PU KCIP

—Bear too heavy for bridge?
DNIHEB TI EVAEL, LLORT EHT FFO DERACS S'IT ECNO

Voodoo Castle

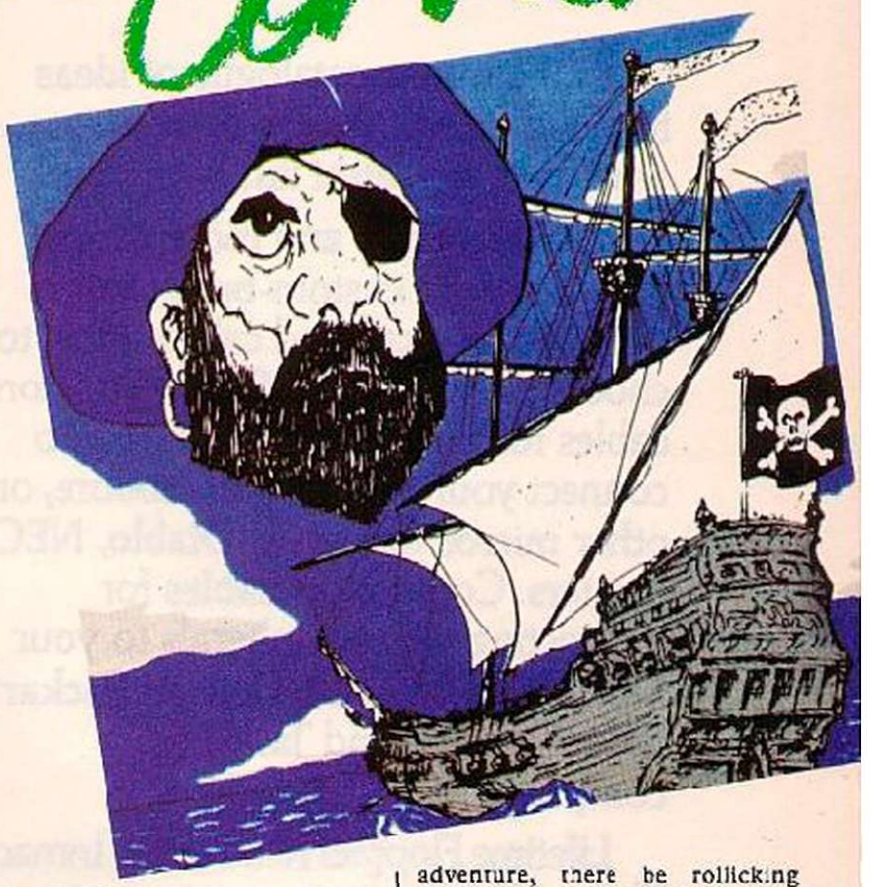
—Unfinished rhyme a mystery?
EGAP GNISSIM EHT DNIF

—Lucky charm causing a pause?
LLOD NO TOOF PORD

If you're baffled, ink you quill and write to yours in mazes and monster-filled mines.

QUEST corner

Our man with the brass lamp and the key to a thousand mysteries sheds light on new adventure programs. Lost? Never fear, Hugo North is here.



Flint's Gold

BBC B
£6.95
Micrograf

AHOY THERE, Jim lad, move that parrot, pull up a chest and harken to me while I tell 'e a tale of pirates bold.

'Tas come to my ears that old Flint buried some of his booty on yonder island. Now, me bucko, all that treasure can be yours but first ye'll have to climb aboard one of those ships moored in the harbour. Mind'e don't get shanghaied or worse — they be a rough lot of swabs in these parts.

If 'e manages to make it to the island with your gizzard unslit, there be plenty more danger awating. Long John'll likely be pegleggin' alongside of 'e and you don't need me to tell 'e to keep a weather eye out for Ben Gunn and Flint's ghost.

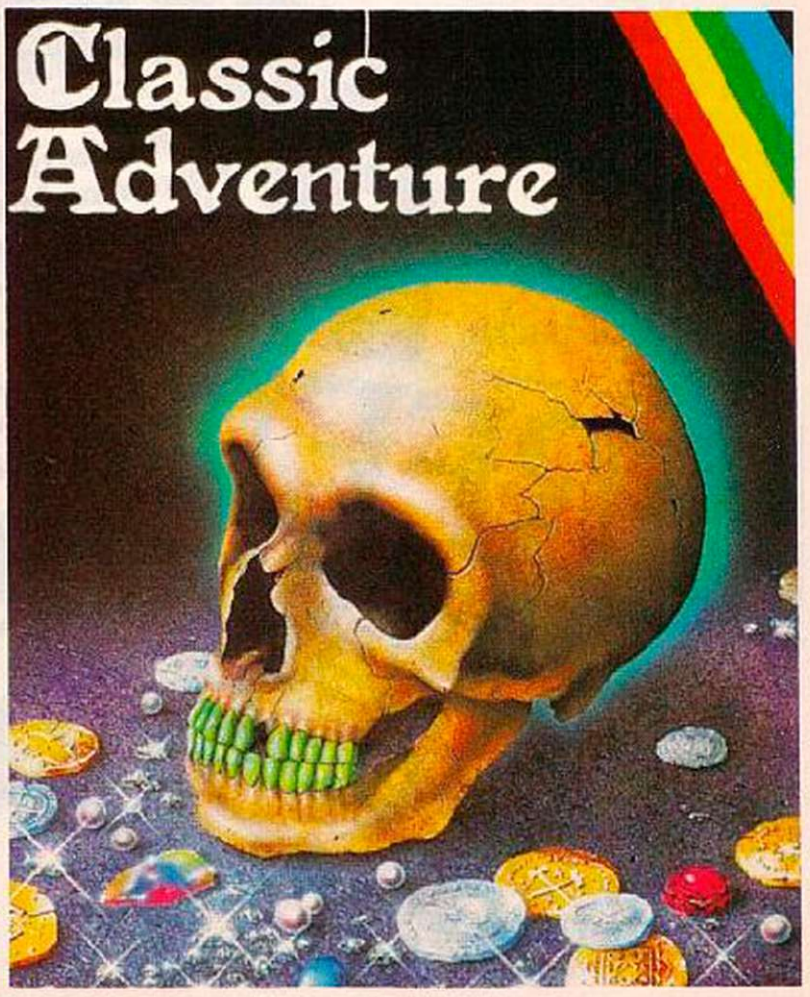
Though this be mainly a text adventure, there be rollicking shanties, squawking seagulls and crashing waves thrown in for good measure. Arr, Jim lad, that son of a sea-dog, Andy Mitchell, has come up with one of the finest yarns this side of the Spanish Main.

Waydor

48K Oric
£7.50
IMS Software

THERE ARE not too many adventures around for the Oric but here's a pretty good one with both text and high-resolution graphics. Your quest is to journey through the strange land of Waydor and recover the legendary eight treasures.

The graphics and interesting full-screen depictions of the locations and are drawn rapidly. The text screen replaces the graphics screen at a touch of a key.



Classic Adventure

48K Spectrum
£5.95
Melbourne House

APTLY NAMED, this text adventure is closely based on the famous Crowther and Woods Colossal Cave.

If you've never played it before, you're in for a treat. There are a large number of problems to solve and locations to explore, the latter being described in some detail.

Among the old favourites are the well house, the locked grate, the black rod and the hall of mists. Those pesky dwarves are there as well, still sneaking up and hurling axes at you. Seasoned adventures will know how to best deal with these nuisances.

Although not as comprehensive as Level 9 Computing's version (Colossal Adventure), it does include most of the flavour and delights of the original classic. Definitely one for your collection.

NOT JUST A PRETTY Inter FACE!

The new dk'tronics Parallel Centronics Interface will link your Spectrum to any printer with a standard centronics input. As the choice is vast, you can select the printer exactly suited to your needs.

Features of the Interface include:

- Runs all parallel centronics type printers
- Controlling software fully relocatable
- Interfaces with any software using the printer channel e.g. Tasword Dev pack etc.
- LLIST LPRINT recognised. High res screen dumps
- All control codes allowed through to printer
- Fully microdrive compatible
- Supplied with full instructions and controlling software

All dk'tronics products are covered by a comprehensive guarantee.

The Spectrum Connection

THE QL AS RELEASED initially was not really suitable for business or pleasure as it had far too many faults and kept crashing. The final version of the QL incorporates the ROM set AH which has overcome some of the criticisms levelled at the first QLs, which were fitted with the FB ROM set.

Those criticisms covered all aspects of the QL: it was slow, had an unfriendly editor, the microdrives were prone to lose files and data, there was no documentation other than for the Psion packages, the network would not allow integration of Spectrums, the RS232 interface had bugs in it, microdrive files in a well-used cartridge would take on age to load, the keyboard felt a bit clattery with a sticking enter key, and so on.

The AH version of the ROM is Sinclair's answer to most of the problems, but it does not present a cure for all the QL's troubles and can not make any difference to the hardware faults.

normally the predominant functions are not mathematical.

The editor although a substantial improvement over the earlier effort is still not good enough. A full screen editor is the minimum requirement for a "next generation" user-friendly computer, not something that requires setting up to provide anything more than basic facilities.

There is about 4K of ROM unused, which makes it hard to understand why a full screen editor has not been implemented.

If a basic input line exceeds three lines in length in the command and error channel window, error messages associated with the line will not be seen unless that window is expanded to the detriment of output and listing channels. Although the user is able to scroll the window forward, it does not appear possible to scroll back up the line.

The loss of data from microdrives was extremely serious and previously prevented me from using the QL in word processor mode. This problem was a little mystifying as the Spectrum microdrives have worked perfectly for the last nine months without any problems.

Fortunately the QL's (AH version) microdrives appear to be working normally without the problems that were apparent on the very early FB version of the QL.

The other microdrive problem of program loading times, is improved slightly by using a scatter load technique, but the user is still left with the distinct impression that the QL is slower than the Spectrum microdrives. This is not helped by the frequent microdrive accessing that takes place while using the Psion packages.

A problem exists in determining at what stage a package is loaded, so I have provided the time to load Quill in a "ready to start a new letter" state and the shortest time taken to load Quill and this article, that includes pre-typing and buffering commands to reduce the time to a minimum.

Loading times:

	QL-FB	QL-AH	article
Quill	70s	42s	3m 40s
Abacus	77s	38s	
Archive	73s	42s	
Easel	72s	50s	
Install-bas	68s	32s	(300 lines)

The article is about 2900 words long which is approximately 18k. The Spectrum microdrives only take an average of seven seconds to load an 8k program so what on earth is going on? Even allowing for a considerable improvement in knocking, on average, 30 seconds off the loading times, these figures are in no way comparable with disc-drives and frankly are not good enough.

The documentation supplied with the QL is

REVIEW

Following last month's review of the QL, Kathleen Peel takes a close look at the final version incorporating the new ROM set

SECOND LOOK AT THE QL

The first improvement to look at is speed, the new ROM QL's are quicker and the following table gives the benchmark times and puts them into perspective by comparing with other well-known computers.

	Amstrad £330	BBC £399	IBM £1570	Advance £400	QL-FB £400	QL-AH £400	ZX80 —
1	1.1	1.0	1.2	1.0	2.0	1.9	1.5
2	3.3	3.1	4.8	3.4	6.0	5.5	4.7
3	9.2	8.3	11.7	7.4	11.0	9.4	9.2
4	9.6	8.7	12.2	7.5	10.0	9.2	9.0
5	10.2	9.2	13.4	8.2	14.0	11.7	12.7
6	19.0	13.9	23.3	14.8	27.0	24.0	25.9
7	30.2	21.9	37.4	23.6	69.0	43.4	39.2
1	34.2	52.0	30.0	26.0	23.0	21.0	N/A

There is no getting away from the fact that despite all that is said about the QL, comparatively speaking, it is slow other than when performing mathematical calculations, and

reasonably comprehensive in terms of content and suitable for the average computer user. It is not really ideal for a novice who will find many of the sections difficult to understand.

The keywords are provided in alphabetical order with examples of each keyword showing some of the types of syntax used by the keyword.

There are some notable omissions from the list of keywords. The ones I found most irritating were the lack of an ON ERROR and RENAME. The ability of the QL to work with a procedural list which may be local to the current program or globally setup on system boot via RESPR is very very useful but it is short-sighted to restrict use of this powerful concept to machine code for want of a few hundred bytes of code in ROM.

While Formatting a drive, the type-ahead buffer appears to be limited to seven characters.

The mathematical functions ASIN and ACOS are present in ROM but not in the Keyword list. Trying the standard scientific calculator test of taking sine, cos etc and then the inverse gave results with an accuracy about the same as the Spectrum. The scientific accuracy seems to depend on look-up tables which do not give highly accurate results. As in any test, arbitrary values are chosen to evaluate and the real accuracy may be worse.

There is an error in PI which gives a value of greater than one at 90° i.e.

PRINT (SIN(90*PI/180))—1 IS POSITIVE

This results in a whole range of errors with trigonometric calculations that use PI.

The only way to find out how good Superbasic is involves using it, so I wrote a 68000 disassembler. I must admit that Superbasic was very easy to control and helped produce a Basic program which looked better in readability, the only real difficulty was in trying to alter procedures and not being able to view the remainder of the procedure. This just emphasized the lack of a screen editor.

Unfortunately, it is still possible to crash the system, the fault lies somewhere in the renumber and auto commands after having aborted a procedure with "break".

The output was extremely difficult to format, there was no special print control similar to the IBM PC's "print using". One other rather strange point was that the QL rewrote "lprint" in a program in capital letters indicating that it was a keyword, which it is not.

Interfacing via the non-standard telephone plug type EICC RS232 sockets now appears satisfactory and all RS232 communications tried were successful. The lack of split speed 1200/75 working does put a limitation on use that seems hard to justify but other than that there is no criticism of the interface.

The network interface still does not allow what one would have thought of as normal operation, i.e. A QL main station with many slave Spectrums and QL's, a situation that one might expect in an educational environment. The Spectrum sends down the net tokenised keywords, which the QL cannot understand. Considering that early publicity mentioned such a networking capability, it is a little disappointing to find that it still cannot be done.

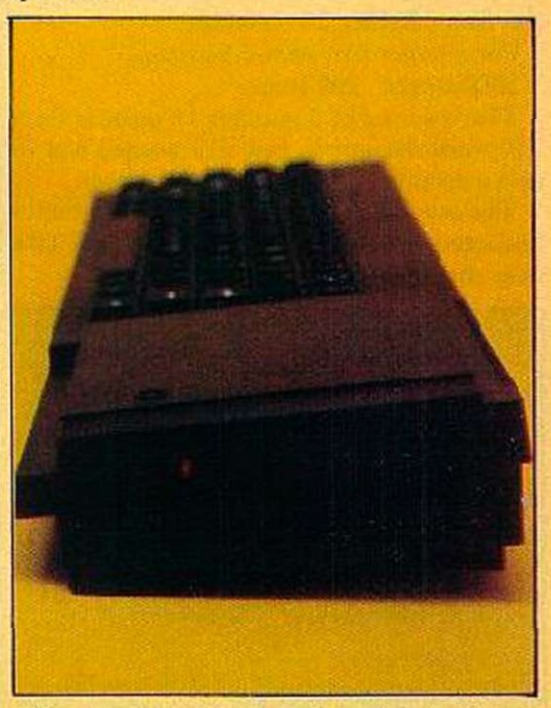
Multi-tasking is a claimed feature of the QL, which the literature omits to explain is only available via machine code, again a great pity as the stack control necessary to provide multi-tasking from Basic does not appear too difficult or greedy in terms of machine code length.

The documentation provided gives an insight into the capabilities of the QL, which are very considerable. As long as the development of the QL continues, then within a six month period all the necessary improvements could be made and a computer that would compare with other Sinclair products for innovation and technical expertise would be available. However, failure to make these improvements could have serious consequences for Sinclair. There are better, faster and cheaper 8-bit machines for the games enthusiasts and on the business front, competition is already intense.

Sinclair appears to be moving into the single board OEM market. A manufacturer buys the bare board, adds his own operating system in ROM, puts a different case around the board and sells it as an own-brand business computer. The advantages to the QL user could be quite substantial, if some of the alternative operating systems were floppy disc based and used an accredited operating system like UNIX, a field which Motorola are keen to exploit. There would be ample opportunity to upgrade to a standard operating system and perhaps a better high-level language as it is unlikely that OEM equipment would contain Sinclair SuperBasic.

Sir Clive Sinclair has come in for some hard words over late delivery of the QL. Will criticism be stilled now the final version is being delivered?

Some pertinent observations should be made regarding the performance of Quill. This package certainly does most of the things you would expect, but the overriding impression is one of it's slowness. In providing a wide range of facilities someone forgot that the principle requirement is one of speed, and that sitting around waiting for the drives to stop and release the keyboard while you take a temporary copy, and move through the text, or the agonising wait, question and answer routine to load Quill and a document is not what it is all about. I can do better with Tasword on a microdrive working with a Spectrum.



The problem is that the package is not matched to the hardware, both items appearing to have been developed in isolation.

Quill should be better on a half megabyte QL. But that's not available and puts the QL into another price range. Regrettably it's present size makes it unsuitable except as an occasionally used word processor.

The Psion packages are inconsistent in command entry syntax, sometimes requiring just the first letter to be typed, at other times ENTER must be typed as well, some commands are selected from a menu and others are toggled on and off, the same letter can mean different things depending upon the menu currently in force, which can be very confusing.

Deleting backwards is very hit and miss as the user invariably tries to delete a word with five or six quick key presses only to find that the display lags rather a long way behind.

As an example of the use of the Psion package, imagine I am working on a short article of 1000 words. I already have one copy of 500 words on microdrive 2 and I wish to take an interim copy of the latest version which is up to 750 words. This is the sequence of events:

1 Press F3 key followed by 6

(this calls up the command menu-s=save. A period of 35 seconds elapses by which time the computer has found the save section of Quill and then asks if I wish to save the default file, i.e. the file I am working on.

(continued on next page)

(continued from previous page)

2 Press ENTER

(after a further 10 second the computer finds that the file already exists and asks if I wish to overwrite it.)

3 Press Y

(a period of 100 seconds elapses while the old file is erased and the new one saved and verified in it's place, the user is then asked if he wishes to carry on with the same document.)

4 Press ENTER

(Why a further 25 seconds is required here is beyond me as the file must be in memory as we have just saved it). Unfortunately, the file is now at the start, so to get back where I was:

5 Press F3 key then G following by B.

(The Goto procedure to get to the Bottom of the file, a further 28 seconds).

For a larger file, item 3 becomes:

3000 words 200 secs.

That's a total of 3 minutes 18 seconds for a 750 word document, and all I wanted was to save a document form and then continue.

The commands can be typed into the buffer and executed in sequence but they still take over three minutes to complete.

CONCLUSIONS

- ☐ The new ROM has improved times for benchmark tests compared with the earlier FB version, but the QL is comparatively slow other than when undertaking mathematical calculations.
- ☐ The Quill word processing package has a comprehensive range of facilities but in practice is slow to use.
- ☐ Program loading times via the microdrive appear to be slower than on the Spectrum.
- ☐ Despite the fact that it is a multitasking machine the QL does not provide spooling of printing with input operations.
- ☐ In hardware terms the QL currently represents the ultimate in technical achievement in computers priced at £400.

If after saving the file the user does not press ENTER to the request "save, same document", which is in fact asking if the user wishes to continue with the same document, the data file is dumped and the user ends up with a blank page — not exactly user friendly.

I had hoped to be able to recover a document from microdrive in the same system state as when the file was saved, unfortunately Quill requires the user to reconfigure much from the default set-up every time.

I had also hoped to be able to load the "def-doc" automatically instead of having to specify the document I wished to use.

Quill does not support wild card operations and the search and replace facility is not automatic, requiring a response from the operator at every occurrence.

It does not appear possible to import program files into Quill although files can be imported from the other Psion packages.

Perhaps printing is better? But no, even with this multitasking machine, while the printer was working, I could not. I had hoped that the document could be printed whilst I worked — it's just a case of spooling a copy as a lower priority job. Worst of all, it sends me back to the beginning of the document when it is finished.

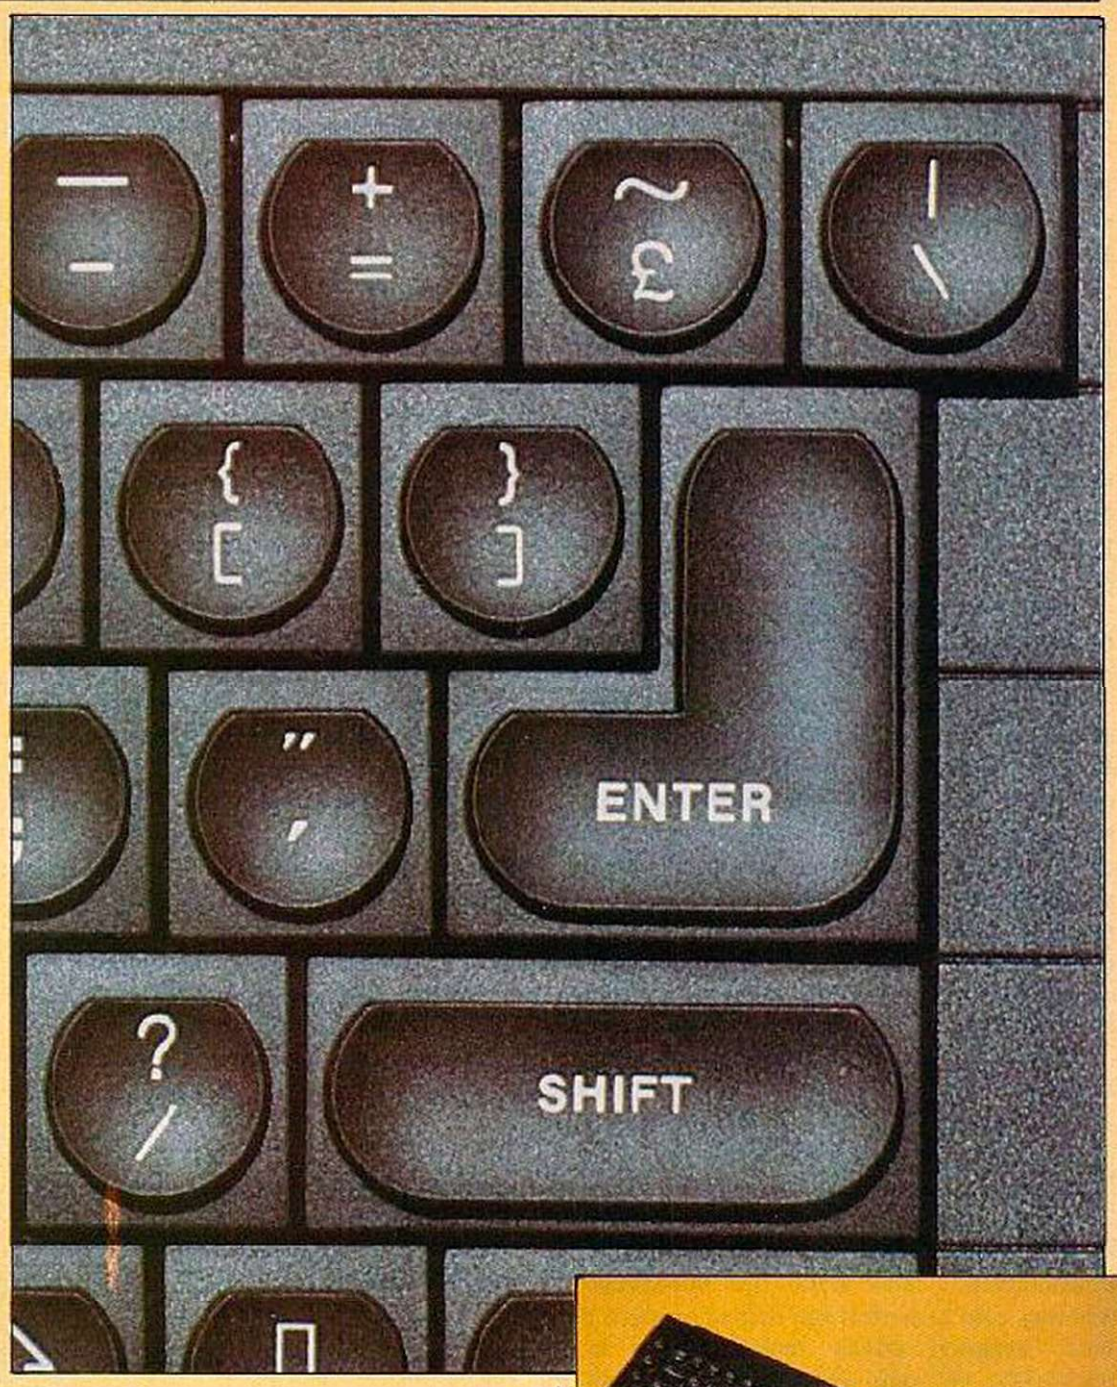
This document takes over six minutes to print at 1200 baud on an 80 character per second printer.

When the part of the document in memory reaches a certain size, either all or a part is dumped to microdrive and although while this occurs the user can still type, nothing happens on the screen until the drives stop.

The block erase facility is controlled by the cursor keys which enable the user to "surround" the text to be erased. Unfortunately, if the user overscans the block to be erased, it does not appear possible to reduce the size of the text block to be erased and the user is forced to ESC and restart or to complete the erasure and re-enter the text deleted, but still required.

In spite of what is claimed in the manual, a default page size of 0 does leave breaks in the document, at steps of 256 lines, although it does not number the breaks as pages.

The Quill designers have to make up their minds as to whether Quill will include all the facilities of the best word processors or try and produce a more realistic match between software and hardware in an attempt to obtain a reasonable level of performance.



If you already have a monitor it probably will not be compatible with your QL. The picture will overscan on most monitors and some TV's. This is a function of the flyback time and to cover the problem Microvitec are producing a special QL compatible monitor.

There has been a lot of discussion about the speed — or lack of it with the QL. This review is based on the usual set of tests used in all the reviews I prepare. In this instance, more detail is given to provide the reader with enough information to come to a personal view about the QL.

What appears to be out of keeping with such an advanced hardware design is the retrograde step of going back to a line editor to support a very sophisticated but unfortunately slow Basic.

That said, it must be conceded that the hardware represents the ultimate in technical achievement in the under £400 range and probably some way beyond. ■

OUR B.B.C./ELECTRON GAMES ARE'NT JUST GOOD TO LOOK AT

NIFTY LIFTY
BBC MODEL B — VB-09-32
ELECTRON — VE-04-32

Your prime objective is to rush through a department store collecting as many goodies as you can without getting squashed flat by seemingly unending and uninterruptable lifts. The only controls involved are left and right and the only skills needed are lightning fast reactions and an over developed spatial co-ordinating ability.

£5 95

PENGI
BBC A/B — 32K RAM OS1-2
VB-04-32

Enormously absorbing and highly challenging, a great favourite for any age of player.

£5 95

DARE DEVIL DENIS
BBC MODEL B — VB-03-
ELECTRON — VE-02-32

The game comprises three scenarios on land, sea and snow with six different skill levels from Novice to Ace. The object of the game is to take Denis through each different scenario doing various stunts and combatting the hazards. For each hazard successfully overcome the day's wages are incremented. The game automatically gets harder as you get better, and as you will find when you play it, it is extremely challenging.

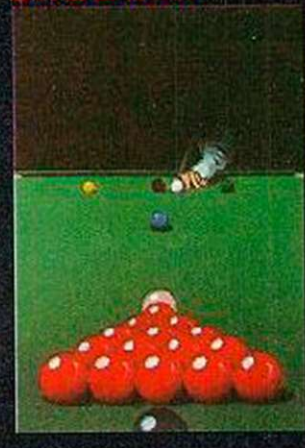
£7 95

DEMOLATOR
BBC MODEL B, OS1-2
VB-.0-32

Demolator is a great game for any age but requires a marked degree of skill as you control movement left and right and up and down and also the fire contro. system.

A marvellous game for anyone with 3 arms or more.

£6.95



SNOOKER
BBC MODEL B — VB-0:-32
ELECTRON — VE-01-32

The game is currently at No 5 in the FCN charts, no mean achievement as it was launched in September of 1983.

The game requires a high degree of skill for proper enjoyment, and it is possible to have a good game with an opponent which would depend purely upon your skill and not luck. However the game can be readily enjoyed from the start because of the extensive instructions and options.

SPECTRUM SOF

IN THE HEART of the city the seven leaders of the industrial west talked world affairs. Across the river, in a darkened room, a Spectrum worked overtime. Two days and 25 programs later its owner reappeared, unshaven; blinking into the light. Battle had been done, but had he won?

Among these Spectrum games it's tough picking a winner, but any prize, if prize there must be, should go to Melbourne House, for their excellent new game, Mugsy.

Mugsy ain't nuttin' special in da concepts — gangsters, can ya play da Godfather and live etc. — but da production is da best. Graphics to keep ya lookin', animation to astound and gangster scenes and gangster talk all combine to make this irresistable. Which is odd, as the logic behind the gameplay is simple, and there aren't that many different possibilities. The wit sustains the game, the presentation does the rest. The chances are that you'll be rubbed out pretty soon anyway, but play while ya can.

About a dozen games into the weekend Airbase Invader, from CP Software, popped up on my screen. In it you're Annie, the peace woman, and your only weapon is the ability to blow kisses. You have got through the wire at Greenham Common and you're trying to stop President — aka Ronnie — Raygun clones, whose only aim is to press the red button. On your way round the bunkers you meet all sorts of vaguely familiar characters, among them Old Bill and the Iron Lady — a heart of steel . . . — and have to avoid them or use kisses to send them away.

Original graphics

In play the game is quite stimulating, but not exceptional. However, like Mugsy, the original graphics carry it off, and it's very hard to stop Raygun pressing that button. Incidentally, there's an interesting footnote — "Any resemblance of any character in this game to any person living or dead is unintended and entirely coincidental." Or dead? . . . And Raygun is spelt differently on the screen too . . .

There are fewer new text adventures around than I'd expect — either people are running out of ideas, or the good ideas are being incorporated into graphics games. Anyway, here are three, all of which hinge round flight — Spyplane from Gilsoft, Alien Adventure from Stephen Hartley Software and Kosmik Pirate from Elephant Software.

Alien Adventure is the wittiest and therefore probably the most engaging of the three, although I never succeeded in getting far. You start on another planet and have to get back to earth. You meet a more interesting variety of creatures on your way than usual, but tend to end up dead, rather than safely home. And if you refuse to play another game you get called a spoilsport. Worth more time than I had, and reacts well to abuse, a tactic most adventurers resort to.

Spyplane sets you up as one, flying above the enemy, trying to get information on their military and naval forces. I spent more time flying into the sea or low mountains, and in the end got bored — it's more of a mind bender than I wanted, and required the kind of painstaking use that only the most dedicated players will give it.

Complicated

In the same vein, but in space rather than sky, Kosmik Pirate will demand as much as you've got to give, if not more, if you are to make any progress. But I found the game too complicated, and the screen display, although more interesting than that on most text-based games, was so complicated that it would take months to understand fully. This may be a selling point, but I'm too impatient for it. And I may have spent too much time in space already.

Only two really unlikely titles in the software sack, the best of which has to be Revenge of the Killer Tomatoes, from Visions Software Factory. Unfortunately, the game doesn't match up to the title, and the storyline is even thinner than you'd expect. Cabbages move round the garden, tomatoes chase you — and later, pumpkins and mushrooms too — and you do your best to tread between cabbages, picking weeds. Nice sprite-type animation, but it doesn't rescue a rather pedestrian game.

The other appealing title is Disco Dan, from Gem Software, which has nothing to do with discoteques, and more with leaping about from disc to disc. Quite exciting, and a starter level to whet your appetite before you even get that far. Similar in many ways to the various Q-Bert games, but more addictive, and to my mind more enjoyable too. Dance? . . . I could have tried.

Three more to add to an increasing army of games that combine the fun of adventuring with the visual appeal of graphics, and all three are good value; Titanic from R&R Software, Millionaire from Incentive and Howzat! from Wyvern Software.

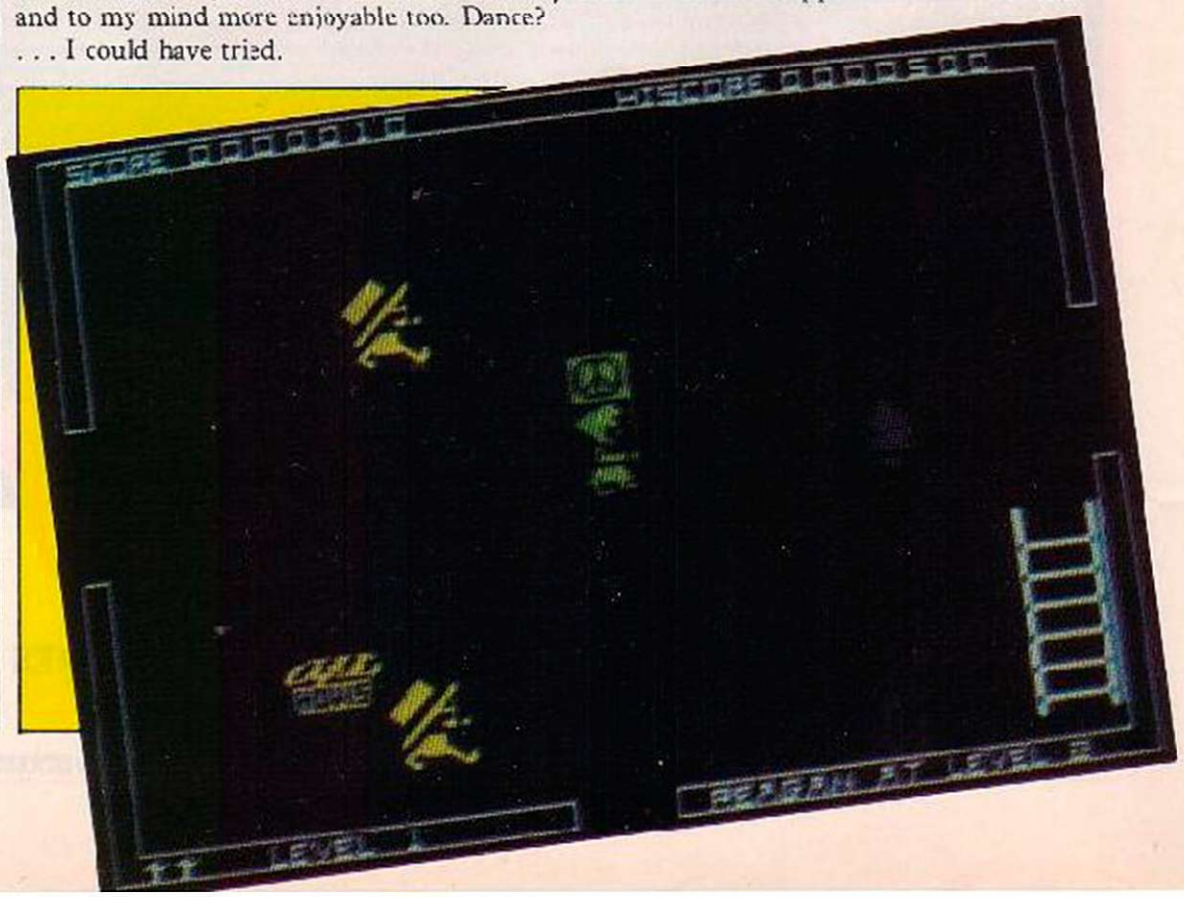
Titanic comes in several parts, all of which simulate accurately what you would have to do in real life if you were to try and find treasure aboard the Titanic. Get sponsorship, spend it, find the ship, and then find the treasure inside.

Most of the wrecks you find seem to kill off your divers, so you'll need more than one team. A pity that I found the treasure on my first trip, but in subsequent games I couldn't, so it must have been luck. Well thought out, lots of graphics, and stimulating all round.

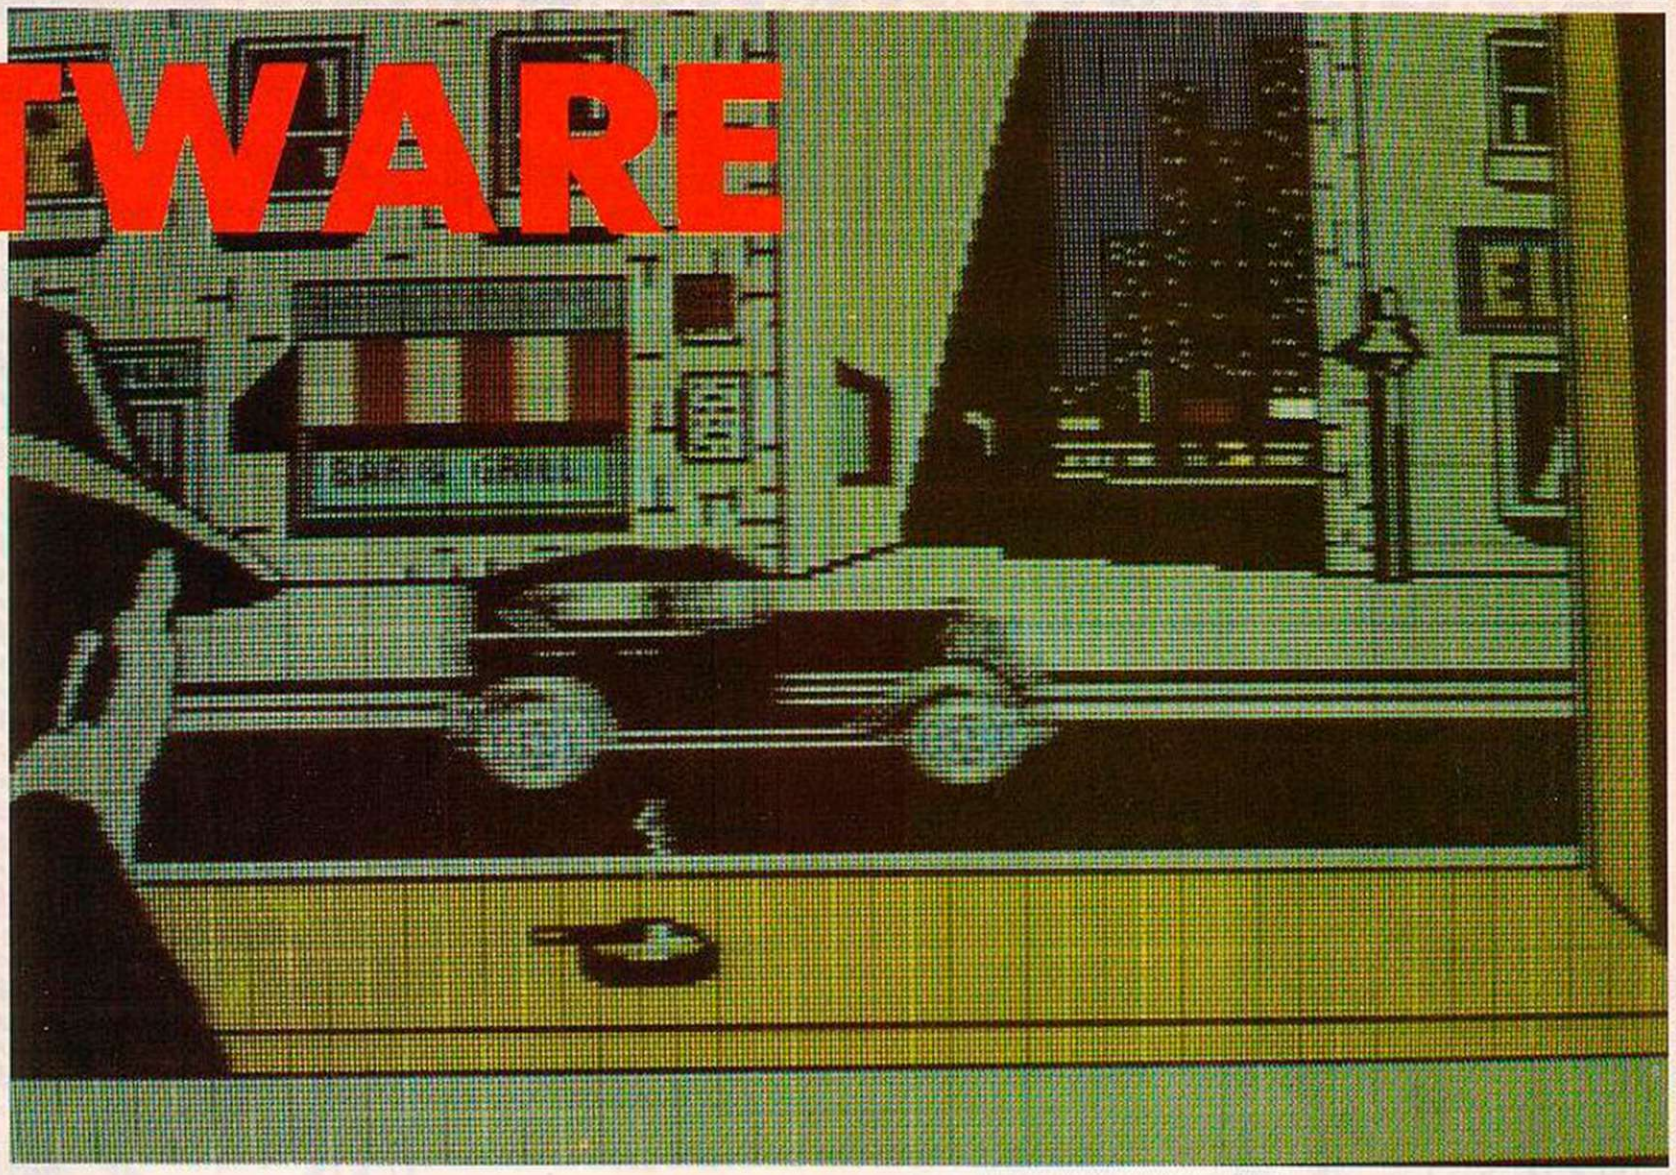
Making money

Millionaire, predictably, is about making money. Starting a software company to do so though is a novel idea. How much time do you spend programming? How much money on advertising? Can you trust Honest Harry's deals? All good stuff, and graphically sound. The only disadvantage is that you don't get much variety from month to month, and the game can get a bit wearing. Enjoyable, but for how long?

Howzat! is not technically an adventure, but is played like one. It must be the best cricket game on the market — just the thing to get out when rain stops the real play. You can have any of the County or Test sides, select from the squads, change the skill levels of players, and get full batting and bowling cards, as well as an excellent scoreboard. And the game graphics are good too — watch the players running for the ball or the wicket, and change the field. Like the real thing it takes hours; after 45 overs I stopped for tea. Excellent.



:TWARE



Both Metagalactic Llamas from Salamander and Blade Alley from PSS are classic shoot 'em up games, though their origins are very different. The Llamas game is an adaptation of the arcade game which I never liked. You either love or hate this version too, and I didn't love it — although inquisitive neighbours did. Blade Alley is a 3-D shoot up version of space invaders with about as much *raison d'etre*. However, it is curiously addictive, and has a wide variety of things flying at you. A shame I couldn't use it with Currah's Micro speech.

The best games are often just variations on an idea that has been going round for years. Unfortunatley, so are the worst. Eric and the Floaters, from Hudson Soft, is based on an interesting idea — go round a maze, demolish bits with bombs, try to find treasure, and destroy the balloons — but although you keep playing the game you end up asking yourself why. Semi-addictive, useful graphics, some visual appeal — a rather ordinary game. Perhaps because the cover is better than the contents.

This also applies to Carpet Capers, from Terminal Software, which is fun to play, but completely pointless. Very clever, what with its smooth scrolling, and complete absence of flickering movement, but it failed to hold my attention. Laying carpets isn't my line. Neither is playing RED/Sunshine's Zipper Flipper, computerised pinball for the home. Pinball has a physical charm which doesn't translate to the screen, which is a pity, as, like Carpet Capers, it's all very cleverly done.

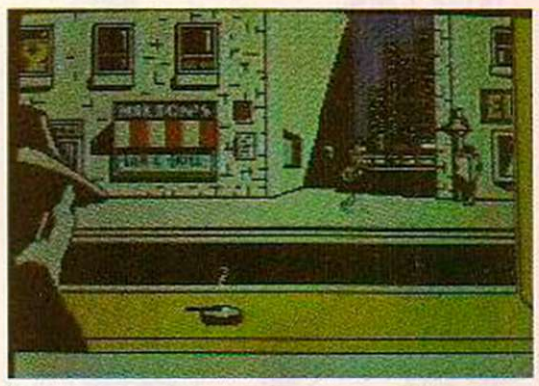
Three from Pulsonic — Worm Attack, Butterfly and Opposition — fall into the same category. All very well programmed, but Opposition could be better played on a board, and Butterfly and Worm Attack just aren't that interesting. No doubt they'll be played, but will they be remembered?

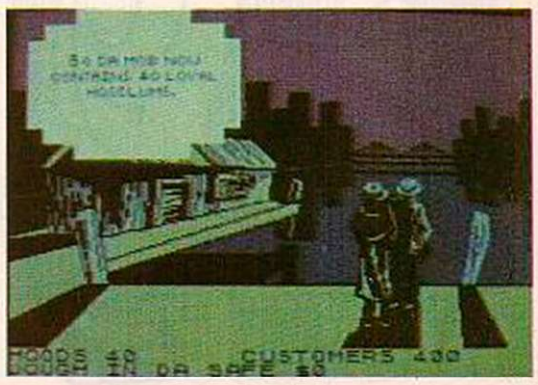
And lastly, Trom from DK'tronics. An afternoon hobby, and a tricky, fast action game. After the first afternoon the novelty wears off. More screens might have done the trick . . .

Carnival, from Eclipse Software, puts you in the shooting gallery, but it's more fun and harder than it sounds. Blasting away randomly doesn't help, but being methodical in your shooting does. Appeal for all, and nice graphics.

And a novelty of marketing, rather than gaming must be K-Tel's Defusion and Worms, a pair of games on the same tape. You'll find them familiar, like stale bread, but the tape is good value nonetheless.

Driller Tanks, another from Hudson Soft, has an instant appeal, but turns out to be another chase/be-chased-by-the-monsters-'round-the-maze-game — and the aim (saving the summer palace) hardly seems worth it. And you just can't win. Two more that are unbeatable are Van Driver and Street Racer, both from Profisoft. Although these have the novelty value of being in German — how many Punktes can you get? — neither are up to 1984's high software standards. Van Driver could have been called Ant Chase, and driving through its streets is nothing like as exciting as the real thing; Street Racer is about as exciting as washing up — you just go faster and faster until you crash. Games to keep you off your toes.





MEMOTECH BBC CBM64 SPECTRUM ORIC1 LYNX NASCOM ATARI

Trapped in a fiendish Level 9 Adventure?
Your lamp burning low? Every exit guarded?

You need escape plans! Send for one of Level 9's great new clue sheets for help. The clue sheets are free and each answers hundreds of questions: follow the instructions supplied with your adventure to get one. (Don't forget to send a stamped self-addressed envelope and tell us which game you have.)

NEW REVIEWS: "Level 9 are fast establishing a name for themselves among computer adventurers as the Number 1 producers of quality adventure software. All their adventures are text only, but because of a special coding they have developed, the amount of description and the number of locations packed in 32K is truly amazing."
— Midweek, 10 May 84

"Quicksilva call themselves the 'Game Lords'. That might be open to argument. But there can be no doubt that Pete Austin and the team at Level 9 are the 'Lords of Adventure'.
— Central Press Features, April 84

"Play Lords of Time and get nine times the pleasure!"
— Your Computer, May 84

AVAILABLE FROM: WH Smith and good computer shops nationwide.

If you local dealer doesn't stock Level 9 adventures yet, ask him to contact us or Centresoft, Drake Distribution, Ferranti & Craig, Hi-Tech, Lime Tree, Microdeal, R&R or Wonderbridge.

BBC ROMS

Richard Lambley looks at additional facilities now available in ROM

THE BBC MICRO is the only home computer which allows you to have more than one language on board at once, and the software suppliers have taken advantage of this useful feature to provide not just languages in ROM, but a wide range of utilities.

Beebug's Toolkit ROM is a collection of routines for developing and debugging Basic programs: it is described as a Basic programmer's aid, though you don't need to be an experienced programmer to find it helpful.

Some of its functions simply enhance the resources BBC Basic already has: with it, for example, you can renumber individual sections of programs, rearranging blocks of code at will.

But there are many completely new facilities: a "bad program" recovery command, a program packer and Rem stripper, a relocator — useful for disc users — a Check command for verifying programs saved, and a quick method of merging programs together.

The great delight of Toolkit, though, is its error-trapping. Even if you use the keyboard only for typing in games listings, this could save you untold frustration in tracking down trivial mistakes.

One especially useful facility is string search, which scans the program for any sequence of characters you specify, Basic keywords included. The display shows all lines in which the sequence appears, each occurrence highlighted in colour. Allied to this is a search-and-replace utility.

Toolkit's use is restricted to Basic only — it cannot deal with machine code — so to get the most out of it, you need to pair it with a good machine code monitor — such as Beebug's Exmon, or Beebmon — of which more below.

Some of Toolkit's commands are less useful than others; nevertheless, it must be one of the most worthwhile utilities yet produced for the BBC Micro, and at £27 it represents excellent value for money. There is a discount for Beebug subscribers.

Another interesting extension to the standard BBC is provided by Computer Concepts' Graphics Rom costing £33.35. This miscellany of graphics functions falls into three parts: a collection of Logo-style turtle graphics commands for drawing patterns, some sprite utilities, and a number of useful tricks. These include a quick *Circle command, which can whistle one up in just a sixth of a second. It's actually an ellipse, because the BBC's pixels aren't quite square; but no matter, you can always make a real circle using *Arc.

Nosuchvariable

Figure 1.

There's an intriguing *Plot command, which extends the Basic plot command into the third dimension. And there's *Rotate, which twists the whole screen about a point, making what follows appear on the slant. Some other useful features are a routine for filling shapes on the screen, a *Print command which can produce letters of any size, and a way of getting an endless supply of coloured pattern effects.

The GDUMP ROM from DA Computers offers machine code graphics dumps for a variety of popular printers, including models by Epson, CTI, Star, Seikosha and NEC. The single *Gdump command can be followed by up to nine arguments, which determine the number of shades of grey, the logical background colour, the size of the print-out, which way up it is to be and so on. Sensible default assumptions have been made, so most of the time you don't need to specify more than two or three. The last four arguments define a "print window" for dumping just part of the screen.

Gdump works in all graphics modes including mode 7: in this mode it does not give colour shading or double height characters, but it reproduces block graphics successfully and quickly in a 40-column-wide print-out. At £20, it's good value.

A fuller set of printer utilities is available from Computer Concepts in their Printmaster ROM, which at present is available only in an Epson version. Its shaded graphics dumps look much like those of Gdump, but Printmaster can do a colour dump even in mode 7. The many size and scale options do not apply in this mode, but it copes with double-height characters and separated graphics too.

Printmaster also includes a character definer; though here, I think, Computer

Figure 2. Vital statistics: this "info" page from Beebug's Toolkit gives a handy summary of the state of play.

```

Picture by Graphics ROM screendump by Printmaster.

Concepts have for once missed a trick. Instead of giving us a definer to make downloadable characters for the printer — this is, after all, an Epson printer ROM — they have chosen to make it an eight by eight definer for the computer itself.

Another interesting package for printer owners is Beebfont from Watford Electronics. If you're bored with the character set Acorn sold you, with this you can freak out. When I tried it out in the office, it reduced everyone to helpless giggles within moments. There's something irresistibly nutty about a computer which can do things like figure 1.

Those Gothic letters come from one of six alphabets built in to the Beebfont ROM. A further font can be loaded into RAM, and letters from any of them can be mixed together on the screen or on the printed page.

Printing with Beebfont is a slow business, but the results are quite effective. You can dump Wordwise text files to the printer with the help of a spooler routine, supplied on the utilities disc/cassette. Escape commands to switch between fonts can be embedded in the text as required. Beebfont costs £39, which for a 16K-byte eprom seems reasonable.

Incidentally, Beebfont and Printmaster both have a *Font command, which can be a cause of conflict: if you fit both, put Beebfont in the higher priority socket. You can then eliminate any confusion by prefixing commands intended for Printmaster with a C.

THE GAME THAT WILL GET YOUR SPECTRUM BUZZING AGAIN!

Bug-Byte welcome in the Summer with the sensational follow-up to the best-selling 'BIRDS AND BEES' . . . ANTICS!

Boris Bee, the original hero of the famous arcade game has been set upon by a vicious gang of ants and locked away, somewhere within their nest, to await a terrible fate. Fortunately, for Boris, help is at hand in the shape of his cousin, Barnabee, who is about to launch a daring rescue mission.

You control Barnabee as he searches the labyrinthine ants nest in search of his missing friend. Can you rescue Boris and guide him back to safety, or will you perish underground?

ANTICS is a cartoon style maze game, with slick, machine code action, riveting sound effects and joystick compatible.

GSH

Bug-Byte Ltd., Mulberry House, Canning Place, Liverpool.

(continued from page 59)

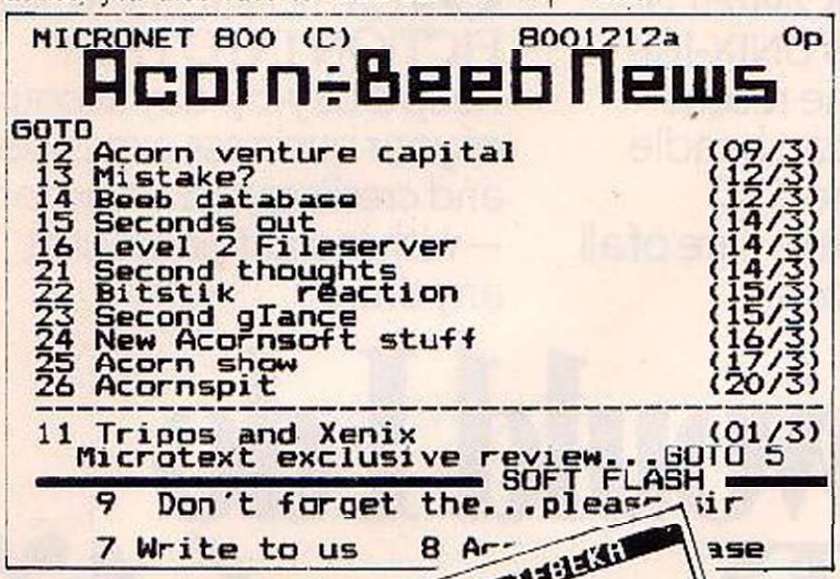
The others will be claimed by Beebfont, which gets the first say. A similar idea is used by Toolkit: in this case an optional B prefix allows you to avoid tangles with the many other ROMS which have a *Edit command.

In spite of having high-level languages such as Basic, most home computers are pretty primitive when it comes to controlling external hardware. Getting even the BBC to do a simple thing like switching your reading lamp on is far from straightforward. When you've connected up the mains switching device, you then have to work out how to address it. You need to know which memory locations to write to and what to write, and you need more than a passing acquaintance with concepts such as data direction registers.

The Control Rom from SJ Research takes care of all these details for you. It acts as an additional filing system, so you can carry out read and write operations through it just as you would with cassette or disc files. And though it's hard to think of the 1MHz bus or the user port as a file medium, making a pin on one or other of them switch "high" or "low" becomes simply a matter of opening a channel to it and putting a byte to file.

There is a small price to be paid in terms of memory: the Control Rom claims four pages for its workspace when you switch on. If you use cassettes or the Kenda disc filing system, you will find Page set to &1200. If you have teletext, an Acorn DFS and Econet, you'll find it at &2900! However, when you don't need I/O facilities you can reclaim this space by typing *Noio followed by a hard reset. The price is £44.85.

Figure 3. Same Prestel page, different screen-dumps. Gdump is six times faster, but Printmaster gives you more frills.



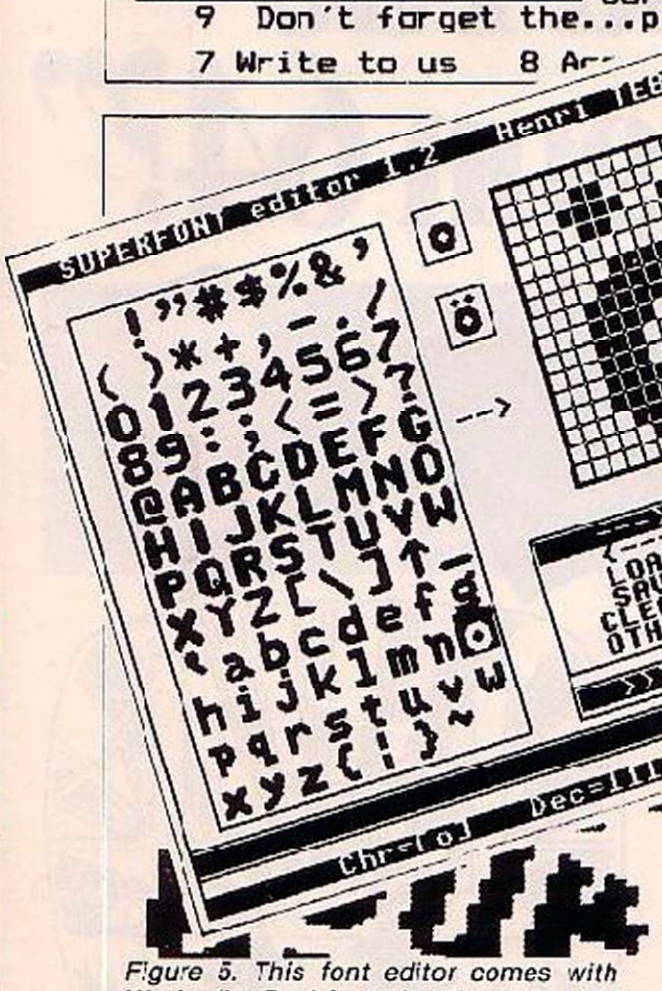


Figure 5. This font editor comes with Watford's Beebfont: it allows you to design you own alphabet or adapt the ones supplied. For comparison, the menu on the right is made up of standard mode 4 characters.

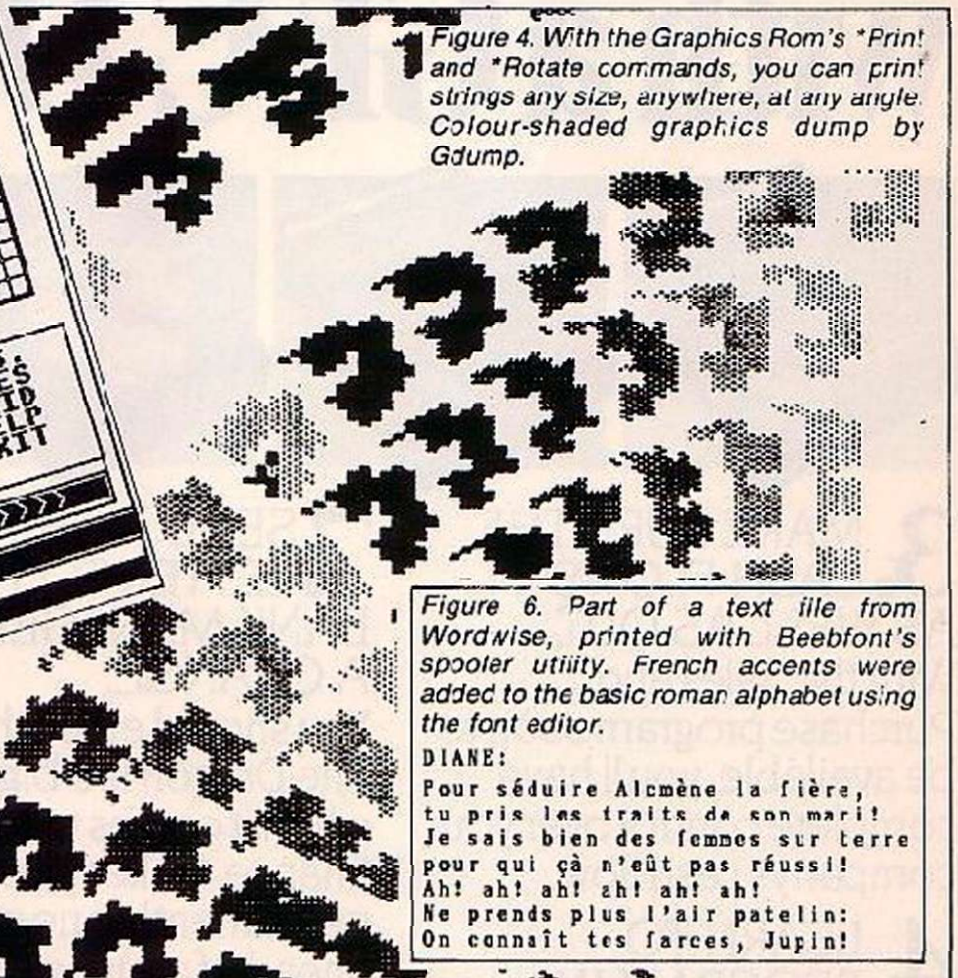

*Figure 4. With the Graphics Rom's *Print and *Rotate commands, you can print strings any size, anywhere, at any angle. Colour-shaded graphics dump by Gdump.*

Figure 6. Part of a text file from Wordwise, printed with Beebfont's spooler utility. French accents were added to the basic roman alphabet using the font editor.

```
DIANE:
Pour séduire Alcmène la fière,
tu pris les traits de son mari!
Je sais bien des femmes sur terre
pour qui çà n'eût pas réussi!
Ah! ah! ah! ah! ah! ah!
Ne prends plus l'air patelin:
On connaît tes farces, Jupin!
```

Figure 7. Look — no Fokes! With the Control ROM you can read or write to the I/O ports using ordinary filing commands.

```

```

1. KEEP TRACK OF THE GOLF CLUB ACCOUNTS.
The GEC Dragon RMS program will record all the details, and prepare the accounts beautifully typed at the end of the year. (Or any other time.)

2. ACHIEVE INSTANT FINANCIAL STATUS.
Whether you're in business or not, the Dragon will give you an accurate picture of your assets (or liabilities) almost instantly.

5. COST OUT JOBS.
Many small businesses are using the GEC Dragon to simplify and speed up their complete job-costing operations – and saving a fortune in the process.

6. INTEGRATE YOUR POLYNOMIALS.
GEC Dragon's UNIX-like software to the rescue again. If you can handle the maths, the GEC Dragon will take care of all the calculations.

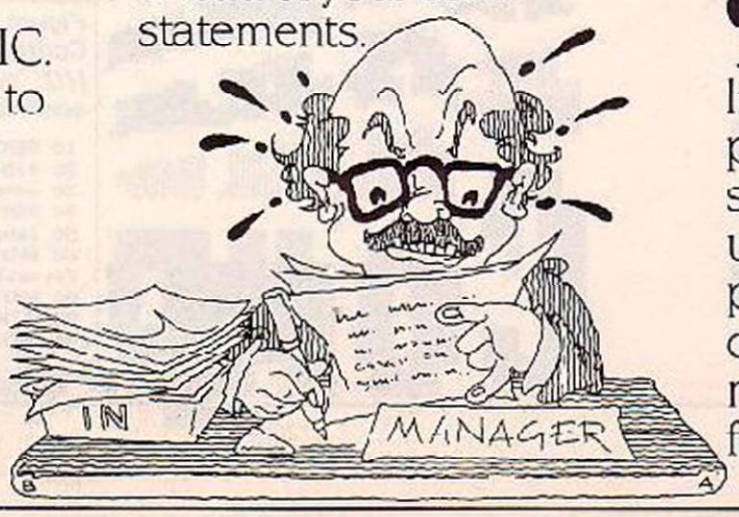
8. TURN YOUR EXPENSES FROM FICTION INTO FACT.
Keep a day-by-day account of your business expenses and credit card transactions – with instant printout at any time.

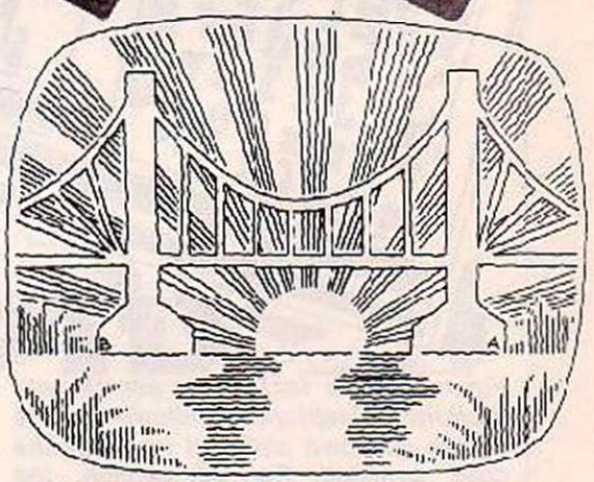
"What else would I do with a GEC Dragon 64?"

3. MAKE SURE THE CASH FLOWS IN. AS WELL AS OUT.
With the Sales and Purchase program soon to be available, you'll have complete control over your company's cash flow.

4. LEARN TO PROGRAM IN PASCAL, C, OR BASIC.
Although it's childsplay to use, the GEC Dragon is certainly not limited to games. In fact it has as much brain power as some computers that cost thousands.

7. SEND A SHIRTY LETTER TO THE BANK MANAGER FOR A CHANGE.
You should enjoy this. The Dragon is a big ally when it comes to personal finance. It'll keep you permanently one step ahead of your bank statements.





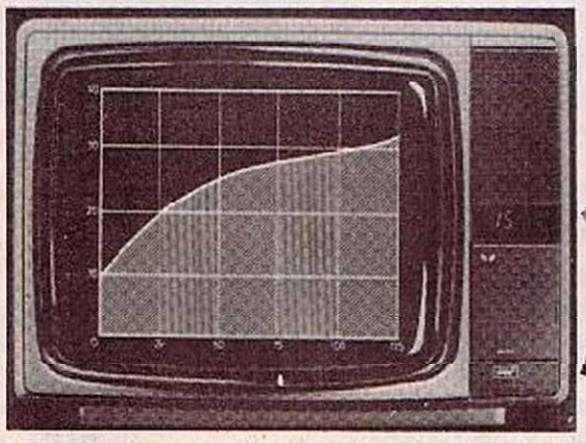
9. DESIGN A BRIDGE.
GEC Dragon's UNIX-like software (based on programs which were specifically designed for universities) will help you perform stress analysis, quantity surveying and many more complex functions.

10. FIND A CURE FOR AMNESIA.

By keeping a personal diary, the GEC Dragon can also help you avoid life's bigger crises. (Like reminding you of your anniversary before your wife does.)

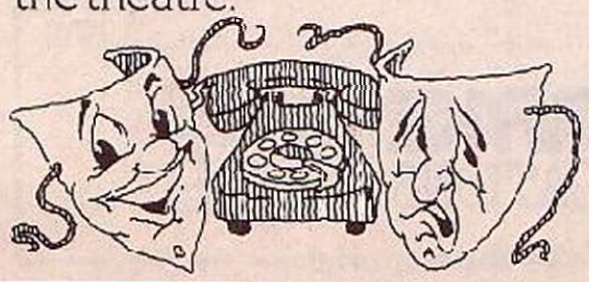
11. FLY TO THE MOON.

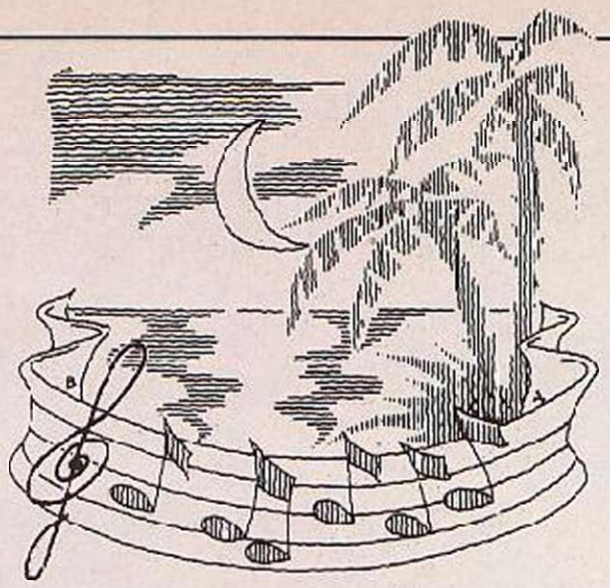
While you're taking it easy with all the spare time your Dragon has created, there are literally hundreds of space adventures and other games to pass the time.



12. CURE THE IMPEDIMENT IN YOUR REACH.

By linking your Dragon to Prestel and the telephone, you'll have immediate access to the very latest information on travel and exchange rates. You can even book up for plays and the theatre.





13. COMPOSE A MOONLIGHT SONATA – ANY TIME OF DAY.

With no less than five octaves, the GEC Dragon is musically very talented.

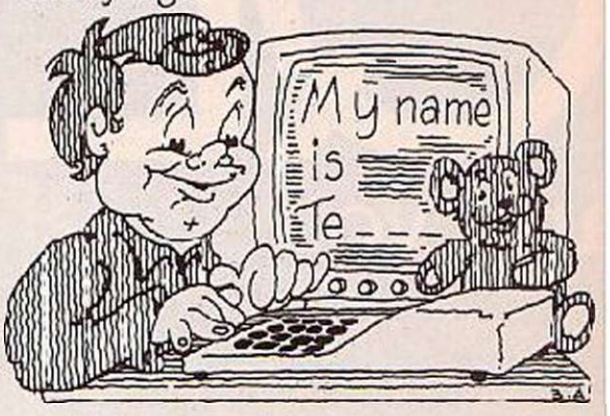
It's no dumb computer, either – you can even get it to talk to you.

14. WRITE YOUR LIFE STORY.

You'll get around 30,000 words of gripping adventure or stunning success on every GEC Dragon 64 floppy disk.

15. TEACH THE KIDS.

From over thirty educational programs, you can teach your children to read and write from a very early age.



There are lots more ways the GEC Dragon 64 can make life simpler.

You can buy the GEC Dragon computer and a wide range of accessories and software from the better computer shops, major stores and GEC dealers.

It's proof that, now GEC and Dragon have got together, we're really going to start turning it on for the small business and serious computer user.

And to whet your appetite still further, we've produced a 12-page colour brochure that tells you how to get the most out of a GEC Dragon 64. It's called 'Your Passport to Professional Software.'

It's yours free in exchange for the coupon below.

GEC DRAGON COMPUTERS

The Sinclair QL and you

Exploring the Sinclair QL — An Introduction to SuperBASIC

Andrew Nelson, £4.95

The QL has a rich, new programming vocabulary, and this great book gives you the chance to master the host of new words Sinclair has added. Sure, you can use the QL more or less just like a Spectrum, but if you do, you are missing the extraordinary power which lies behind the radical concepts of SuperBASIC. Command by command, statement by statement, Andrew Nelson takes you through the richness of QL SuperBASIC in *Exploring the Sinclair QL — An Introduction to SuperBASIC*. Just £4.95 and available from most book and computer shops. In case of difficulty, you can order it directly from Interface Publications, using the coupon below. (Trade only: Interface Publications are distributed exclusively in the UK and Eire by W H S Distributors. Export orders handled by Interface Publications.)

Interface Publications, Department QYC,
9-11 Kensington High Street, London W8 5NP.

Please send me the following books.

Smooth, Cool & In Control

The APPLE User's INSURANCE...

Protect Your Software Investment and take steps to prevent costly, time-consuming errors NOW!

Your Apple is vulnerable to internal overheating and external mains-borne interference — either can induce malfunctions in the Apple's operating software, capable of wrecking data files and programs, losing days or even weeks of work.

Power-Core is your positive move to eliminate such problems. Designed to aesthetically complement and fit snugly on top of your Apple, Power-Core features:-

- **Mains Filtering For the Micro-Processor.**
- **High Air-Flow Cooling Fan.**
- **Additional Power Distribution.** (up to 6 Peripherals)

Power-Core is supplied complete with fitting instructions and all necessary plugs and cables.

A.S.C. products are fully guaranteed for one year and covered by the A.S.C. money back if not satisfied offer. (Return goods within 7 days post paid).

★NEW★ MICRO-HEAT

ONLY £149.50 INC P&P

A hi-spec Power Filtering & Distribution Unit, for use with ANY Micro System.

The heart of the Micro-Heat is a sophisticated high performance line filter, designed for applications demanding maximum protection from local or remote mains-borne interference as well as high energy spikes. Achieved by combining a high performance broadband filter with transient voltage suppressor circuit. Micro-Heat is capable of delivering 2.5kW (13A) to run several critical systems assuring maximum protection to your local computer network.

Features:-
1. C.P.U. outlet switched separately
2. Printer output switched separately.
3. Four auxiliary outlets operative when system switched on.
4. Security Mains Key switch.

For the technically minded: Input 240v Current 10A Operating temperature -15°C to +45°C Interference attenuation - 120kHz better than -33dB - 10MHz better than -10dB Spike suppression to 2.5 kV Transient reduction from varying transient between 240v-1000v

ONLY £149.50 INC P&P

48k SPECTRUM OWNERS

READ THIS FROM DCP

MACHINE CODE TEST TOOLS FOR SPECTRUM, ZX81 AND TS1000

The ultimate professional tutor and de-bug program, we wrote these to help us write our own machine code programs.
● **TEST** and display machine code instructions as they're written. ● **IDEAL** for both the novice and the expert. ● **FULLY** documented with a 32 page tutorial
● **HEX:DECIMAL** conversion as standard. ● **CHARACTER GENERATOR** — of unbelievable quality!!! supplied free with the spectrum version.

MASTER TOOLKIT (16/48K)

YOUR BASIC WILL NEVER BE THE SAME AGAIN
This program adds a whole range of really powerful commands:— ● Real time clock and alarm with on/off/set and print commands. ● BLOCK MOVE, COPY, DELETE and MERGE two lines, FIND and CHANGE character string, RENUMBER, 10 programmable keys, TRACE with execution display, VARIABLE display and dump, COMPRESS REMKILL and PACK to minimise program bytes, CHANGE CASE upper to lower and back.

FULL SCREEN EDITOR/ASSEMBLER (16/48K)

voted THE MOST POWERFUL MACHINE CODE PROGRAMMING TOOL YET SEEN by HOME COMPUTER WEEKLY
● Editing facilities comparable to the most sophisticated word processor with MOVE, COPY and/or DELETE lines or blocks of code. ● LOCATE, CHANGE or DELETE strings/characters, full 280 set supported, syntax check, powerful expression evaluator etc. and 'SNAKE' a fully notated source code demonstration program.

ADDRESS MANAGER (16/48K)

Works on the 16K and 48K Spectrum, in 48K it will store, file, select and retrieve over 400 full addresses (over 1500 individual names): Dynamic Memory Management and compression techniques makes all this possible and there's a lot more: ● **FULL SCREEN INPUT and EDITING** — see it as a page as it happens with insert, delete and TAB Commands. ● **MULTIPLE INDEXING** — 3 way user-defined index enables you to define, catalogue, select and print entries as needed, (essential for the more sophisticated applications) ● **INSTANT RESPONSE** — yes this program is very very fast. ● **SUPER FRIENDLY** — extremely easy to use and efficient in a way that BASIC can never be. Standard Program uses ZX Printer.

FINANCE MANAGER (48K)

FINANCE MANAGER is a powerful, flexible and fast MENU DRIVEN general purpose program carefully designed to handle up to 255 separate accounts for domestic and business accounting applications. The magic of MACHINE CODE has enabled us to produce the very latest "on the page" presentation which lets you enter and edit data naturally, as if with a pencil and paper. But that's not all, not by a long way. This program automatically raises a corresponding debit or credit for every entry, and will even open a new account if an entry features an unrecorded account name. Accounts can be MERGED, DELETED, ANALYSED, MARKED, as priority, RENAMED, EDITED and SCROLLED. Transactions can be RECONCILED, AMENDED, DELETED, PRINTED, DESCRIBED for analysis and RENAMED. Standing orders can be APPLIED, REMOVED, DESCRIBED, AMENDED, DELETED and even DUMMIED for planning purposes. Standard Program uses ZX Printer.

PLUS 80 VERSIONS

of ADDRESS MANAGER, FINANCE MANAGER and EDITOR ASSEMBLER are available to give 80 COLUMN PRINTOUTS USING KEMPSTON'S INTERFACE AND CENTRONICS PRINTER.

CHESS — THE TURK (48K)

The original Turk was an eighteenth century automaton, a life-size mechanical figure resplendent in Turkish costume and seated behind a wooden cabinet on which a chess board and pieces were placed.
OCP now offer you the twentieth century equivalent of that Turk — a chess-playing computer program.
The Turk challenges you to a game of chess!
MANY OPTIONS INCLUDE: ● 6 LEVELS OF DIFFICULTY ● DEMONSTRATION MODE ● BOARD EDITOR ● GAMES PRINTOUT FACILITY ● BLITZ CHESS AGAINST THE CLOCK ● TWO PLAYER MODE
● UNFINISHED GAMES CAN BE STORED ● RECOMMENDED MOVE OPTION ● FULL INSTRUCTIONS PROVIDED

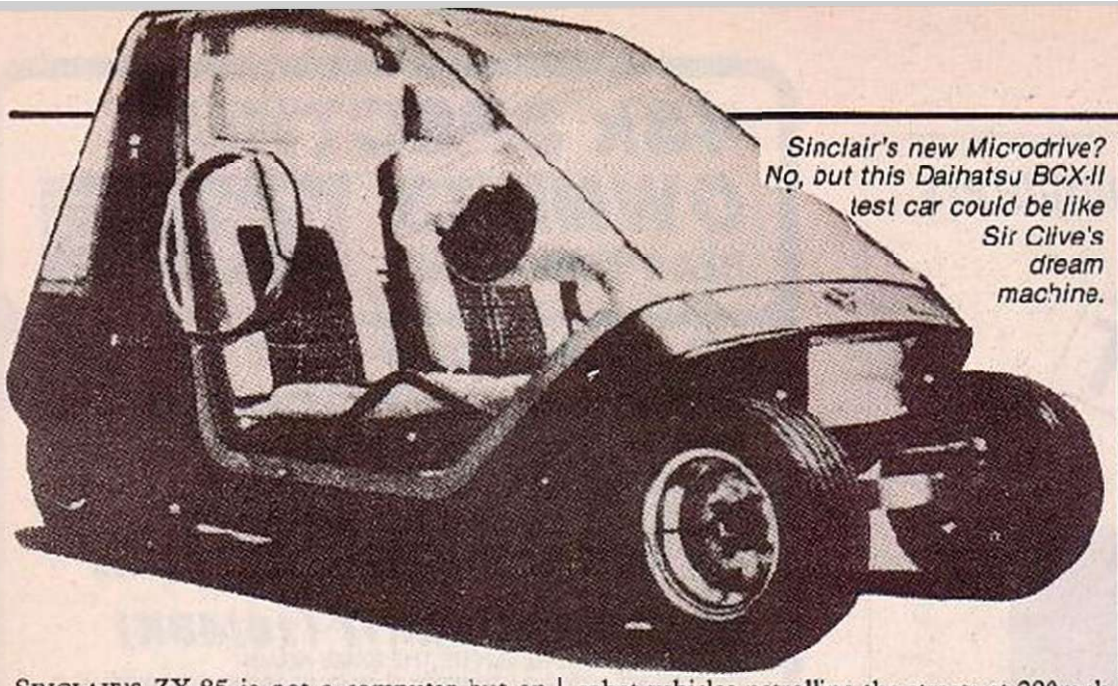
ACCESS CARD NO..... EXPIRY DATE.....



Sinclair's new Microdrive? No, but this Daihatsu BCX-II test car could be like Sir Clive's dream machine.

SINCLAIR'S ZX-85 is not a computer but an electric car — symbolising the fusion of micro and motor technologies.

Sir Clive believes that computer cars will be part of a golden age which micros are driving us to. "I anticipate totally automatic personal vehicles still with all the freedom in space and time of today's cars," he said earlier this year, "but guided by artificial intelligence. They need not then be restricted to 55mph or 70mph on main roads. Speeds of over 200mph should be safely and economically possible."

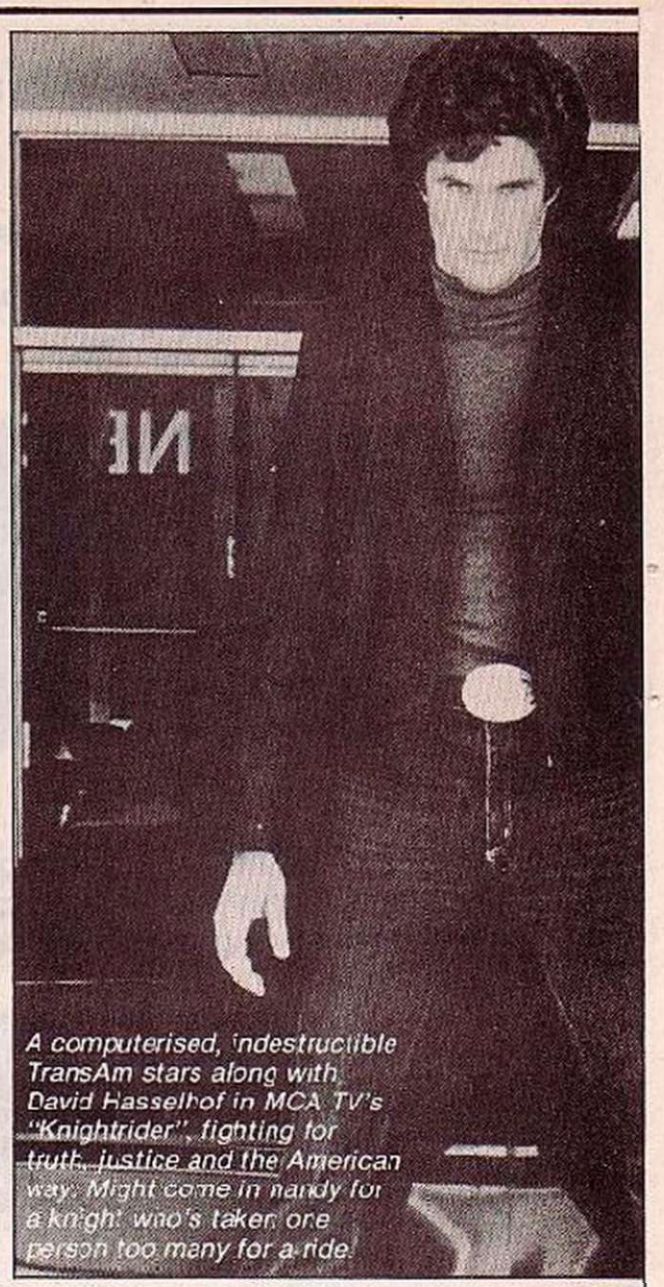
His Sinclair Vehicle Project is committed to producing a low-cost town runabout to be launched next spring. SVP's Managing Director Barrie Wills acted as chief executive of De Lorean Motors when its colourful founder John Z De Lorean found himself on the wrong side of a video camera allegedly discussing cocaine smuggling.

But despite Barrie Wills' experience with high-speed cars and Sinclair's enthusiasm for robot vehicles patrolling the streets at 200mph the ZX-85 will be much less ambitious.

The first vehicle, which will be produced at the Hoover plant in Merthyr Tydfil, South Wales, is a cross between a motorbike and a car, a lightweight three-wheeler which is already being tested in prototype form.

Later Sinclair hopes to build up to a whole family of four-wheeler cars and perhaps light vans. If he achieves the level of production which our sources suggest he is aiming for — 100,000 vehicles in the first year — he will become a major force in the British motor industry almost overnight.

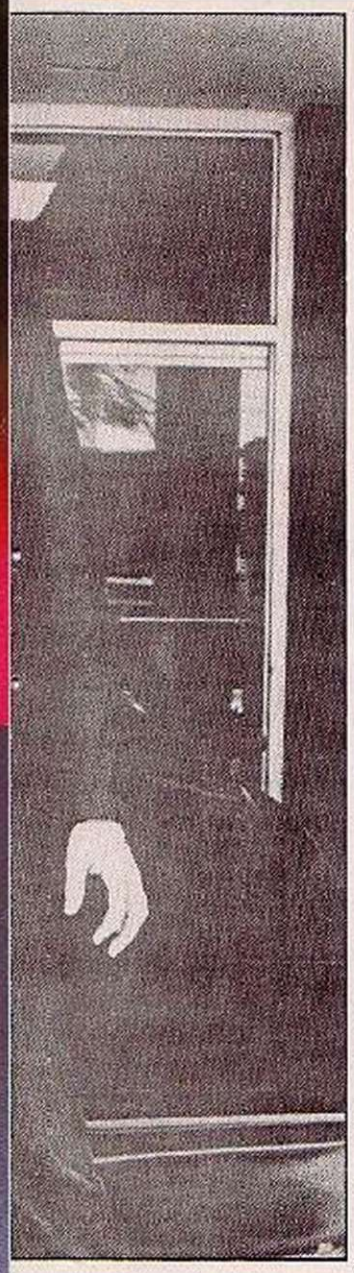
Although Sir Clive began thinking about electric vehicles 10 years ago, development began only in 1981. Little is known about his first machine but it is a safe bet that it will take full advantage of microchip-based gimmicks which cost little to install but substantially increase the price you can charge for a glorified tricycle.



A computerised, indestructible TransAm stars along with David Hasselhof in MCA TV's "Knightrider", fighting for truth, justice and the American way. Might come in handy for a knight who's taken one person too many for a ride.

BREAKING O

Here are two ways computers are helping economy. The 3X6 Granada engine on the right is continuously controlled by the car's micro. This experimental engine management system closes down half its cylinders in heavy traffic. The Renault Vesta below has been designed by computer for ultra-low drag. In fact the test Vesta turned out to have half the drag of most of today's small cars.



SATELLITE NAVIGATION was only one of the wackier innovations in Ford's Continental Concept 100 show car, below right, which demonstrated some of the future uses of micros in cars. Although Ford's future — don't be fooled by its early 1960s "Thunderbirds are Go" styling — car is only just over a year old it has already been superseded in many respects.

It uses keyless entry — a remote control infra-red beam replaces the key — but this year the Renault 25 was launched with that as a standard feature. The crude voice synthesiser incorporated in the Concept 100 has been bettered by the production units in cars like the Austin Rover Montego, Maestro and the new Renaults.

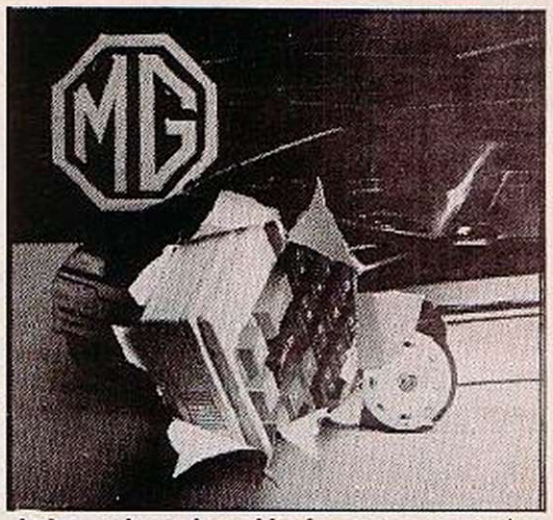
Voice commands which allow you to shout "Mainbeam on", "Raise aerial" or "Wipers on" once you have trained the system to identify these commands has not so far been imitated on production cars. Neither has the sonar detection system which is supposed to help you park without hitting the vehicles around you. But the array of LCD warnings of low fuel, open doors and system failures are now becoming commonplace.

The most extravagant use of a micro in the Concept is for processing signals from the aerial on the boot which receives positional information from a satellite in earth orbit.

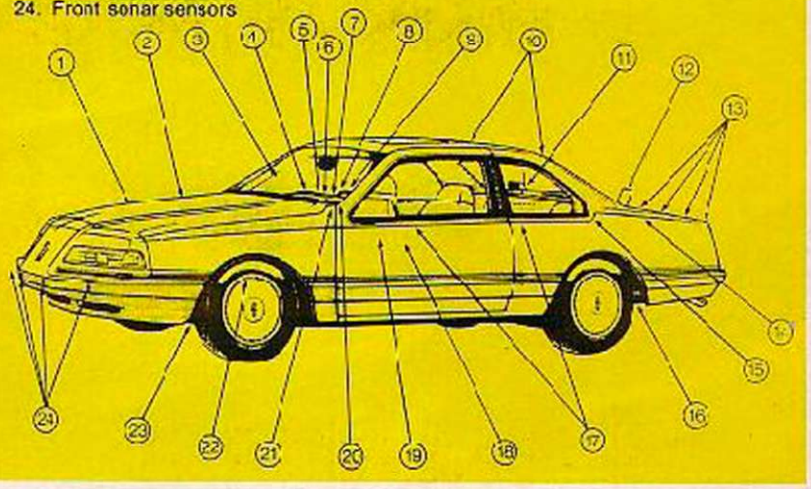
The satellite will tell you where you are to within 400 yards — not much use in central London but helpful for your occasional forays into the Sahara during a sandstorm. Several Japanese companies are working on more practical guidance systems which use loops in the road to emit signals to a car-based micro which allows it to display where you are on a scrolling map built into the dashboard.

Continental Concept 100

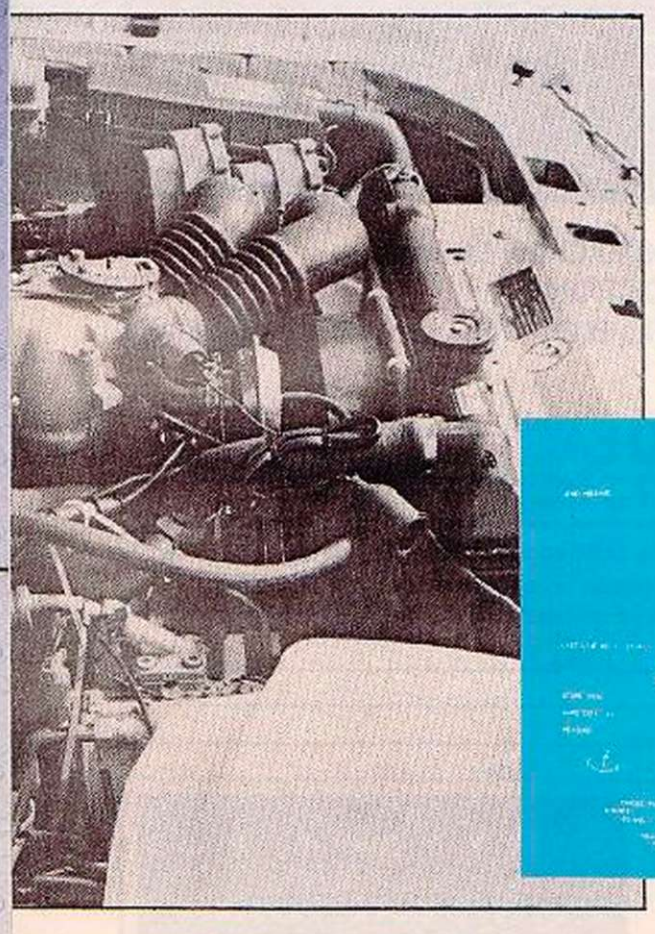
1. Electronic fuel injection
2. Electronic engine control (EEC-IV)
3. Heated windshield
4. Front sonar detection display
5. Interactive CRT display with satellite navigation
6. Voice command
7. Voice alert
8. Keyless ignition
9. Liquid crystal instrument cluster
10. Electroluminescent high-mount brake lamps
11. Rear sonar detection display
12. Satellite antenna
13. Rear sonar sensors
14. Remote convenience system
15. Rear Intellivision game
16. Electronic air suspension
17. Front/rear radio controls
18. Keyless entry
19. Programmable seats
20. Warning module
21. Electroluminescent interior lighting
22. Low tyre pressure transmitter
23. Four wheel anti-skid brakes
24. Front sonar sensors



It's clunk-click every trip as *Your Computer* goes on the road to look at how micros are getting into motoring



ON THROUGH



Ford has been using computers to help it design cars for the last 20 years. Today's micros can run computer-aided design packages more powerful than those Ford used on mainframes to formulate whole cars two decades ago.

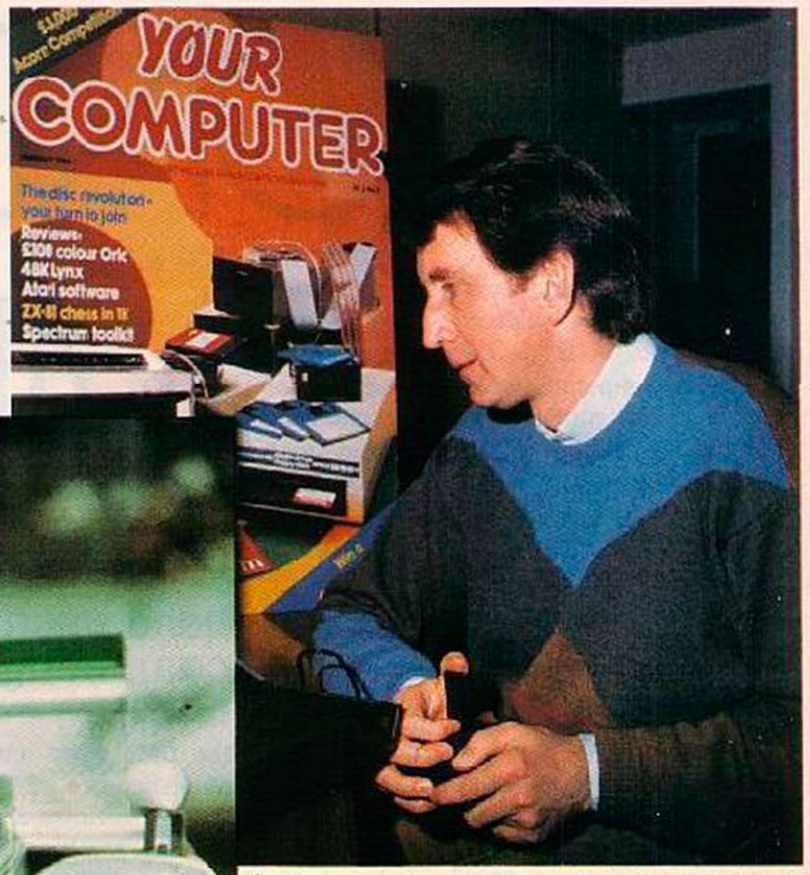
WATSON'S WORDS



Above: John Watson at the controls — "Whoops. Do people actually enjoy these things?". Left: A Jaguar XJR5 similar to that which John Watson drove at Le Mans.

John Watson, Formula One driver tries out some motor racing games. But he'll be sticking to the real thing

WHEN TOP BRITISH Formula One star John Watson found himself without a car for this year's Grand Prix we tried to convince him to give up four wheels for the security of an armchair and take up computer motor racing games instead.

We failed — as his decision to spearhead Jaguar's return to endurance sports car racing at the Les Mans 24 hour shows — but we did get him to trade in his steering wheel for a joystick for an afternoon.

Surprisingly, although Watson has been racing cars for over 20 years and has appeared in adverts for Activision video games he had never laid hands on a home computer or even played an arcade game. For all his skill on the track he found Atari's Pole Position far from elementary.

Watson scooted up the first straight of the Atari Malibu Grand Prix in practice trying to set a fast qualifying time and gain pole position for the race but found himself on the grass at the first corner. "Whoops. Do people actually enjoy these things? I've never done one of these before in my life".

At first John Watson merely poured scorn on computer games and all who play them every time he crashed a car. "This is the sort of thing that would appeal to Andrea very much" he said contemptously. Andrea De Cesaris who now drives for Ligier was one of his rivals last season — "he's got that sort of mentality".

After a whole series of shunts and unscheduled picnics on the grass around the track he finally found his way back to the start — but was shocked to find that he had not qualified for the race. "What's happened, I've stopped now". He took a more serious attitude: "Well I'll just have to try again then".

He cradled the joystick in his hands and concentrated for a few more unsuccessful laps before admitting "these things are addictive in a way. I can see that if you do have a machine that you can get involved in it. I'm useless at it though".

Trying out other race circuit games in the hope that he would be able to master one of them immediately Watson made some cogent criticisms of the controls.

He was not worried by the deficiencies of the pictures on screen. Low resolution and a view from behind your car rather than out of the cockpit were no problem.

"Where it fails for me is sensitivity. I would like to have some controls that move and are more obedient and responsive."

Watson is not impressed by the simple on/off switches used in joysticks. "If only they could make them more responsive. There's no feeling or gradation. You need something like a rheostat, something more progressive. The area where it needs to be improved, for me at least, is in the reaction to the controls. It doesn't react quickly enough for me."

As for keyboard controlled games Watson was not even prepared to consider them. "You're joking" was his reaction to the multi-fingered requirements of Psion's Chequered Flag.

Games like Micromega's 3D Deathchase which add a shoot-em-up element to racing — motorbikes in this case — did not appeal to John Watson at all.

He seemed determined that his first encounter with computer games would also be his last. "As they go on they're going to get more sophisticated. But this for me is terrible. There's no pleasure at all for me."

Perhaps Watson will change his mind after his showing at Le Mans this year. There he dropped out.

SECOND-HAND MICROS

John Dawson guides you through the second-hand micro jungle for computing on the cheap.

WHERE DO OLD computers go to? Are they like elephants and soldiers — fading away without trace — or is there somewhere a municipal computer disposal squad? If you want a cheap computer, is a second-hand machine a good buy? What goes wrong with computers anyway — why don't they go on forever?

These diffuse ideas seem to boil down to four hard questions:

- Where do second-hand computers come from?
- Will a second-hand computer work as a whole or will it be fit only for spare parts?
- Are instruction manuals available and will the machine work without needing an electronic Sherlock Holmes?
- How much do they cost?

There is an increasingly large turnover of microcomputers in commerce and industry and these machines will become available as they are sold second-hand by commercial users. Good commercial advice at present is to write-off a microcomputer over two years.

At the same time as many companies are applying the laws of economics to the hardware they use, many universities are trying to squeeze as much use as possible out of their computers; using the machines past the time when they become commercially non-cost effective and relying on University staff for maintenance.

These machines may or may not be good value after they have been sold off. Demonstration computers, on the other hand, may be almost in new condition apart from scuff marks on the case.

I guess that most of the computers that are sold second-hand by private individuals go because their owner is bored with the machine — he or she has played some games, tried a little Basic programming, and moved on to something else.

The reason maybe simply that they did not appreciate that the Basic coding is the least important part of using a computer successfully — it is the analysis, the understanding of the problem that matters. In contrast, some people selling computers will have discovered the limits of a machine such as the Sinclair Spectrum and wish to exchange their machine for a more capable and sophisticated model.

Domestic computers such as the Vic-20, Dragon, Oric, Spectrum, Commodore 64, BBC Micro, Atari, Nascom, and so on, vary greatly in the reliability of their design. Many machines were launched without the necessary debugging process and it is only the second version of the computer that can be considered to be reliable and a good buy.

The Osborne suffered recurrent troubles with its disc drives until the grey-cased model was introduced. The Dragon and the

Oric had their troubles and even the august Apple II suffers from overheating in some circumstances. Despite this, the integrated circuits used in all of these computers are reasonably stable and reliable.

Provided you acquire the machine after the first short "burning-in" period, you can expect several years of trouble-free operation. After this time the probability of failure rises again owing to thinning of the micro-connections inside the integrated circuit — electro-migration — and breaks in the seal around the leads into the IC allowing water vapour to enter and corrode the chip connections.

Commercial mainframe computer operators expect about seven years operation before the rate of maintenance call-out becomes uneconomic. So, if you can pick up a micro-computer which was originally well designed, a couple of years into its life span, you can expect good value for your money as far as the chips are concerned.

The most fragile components of any micro-computer are the electro-mechanical devices such as the keyboard, disc drives, printer and built-in tape cassette deck. The high voltages associated with the cathode ray tube in the visual display unit may also give trouble and "burning" of the screen is a common problem in ex-commercial VDUs.

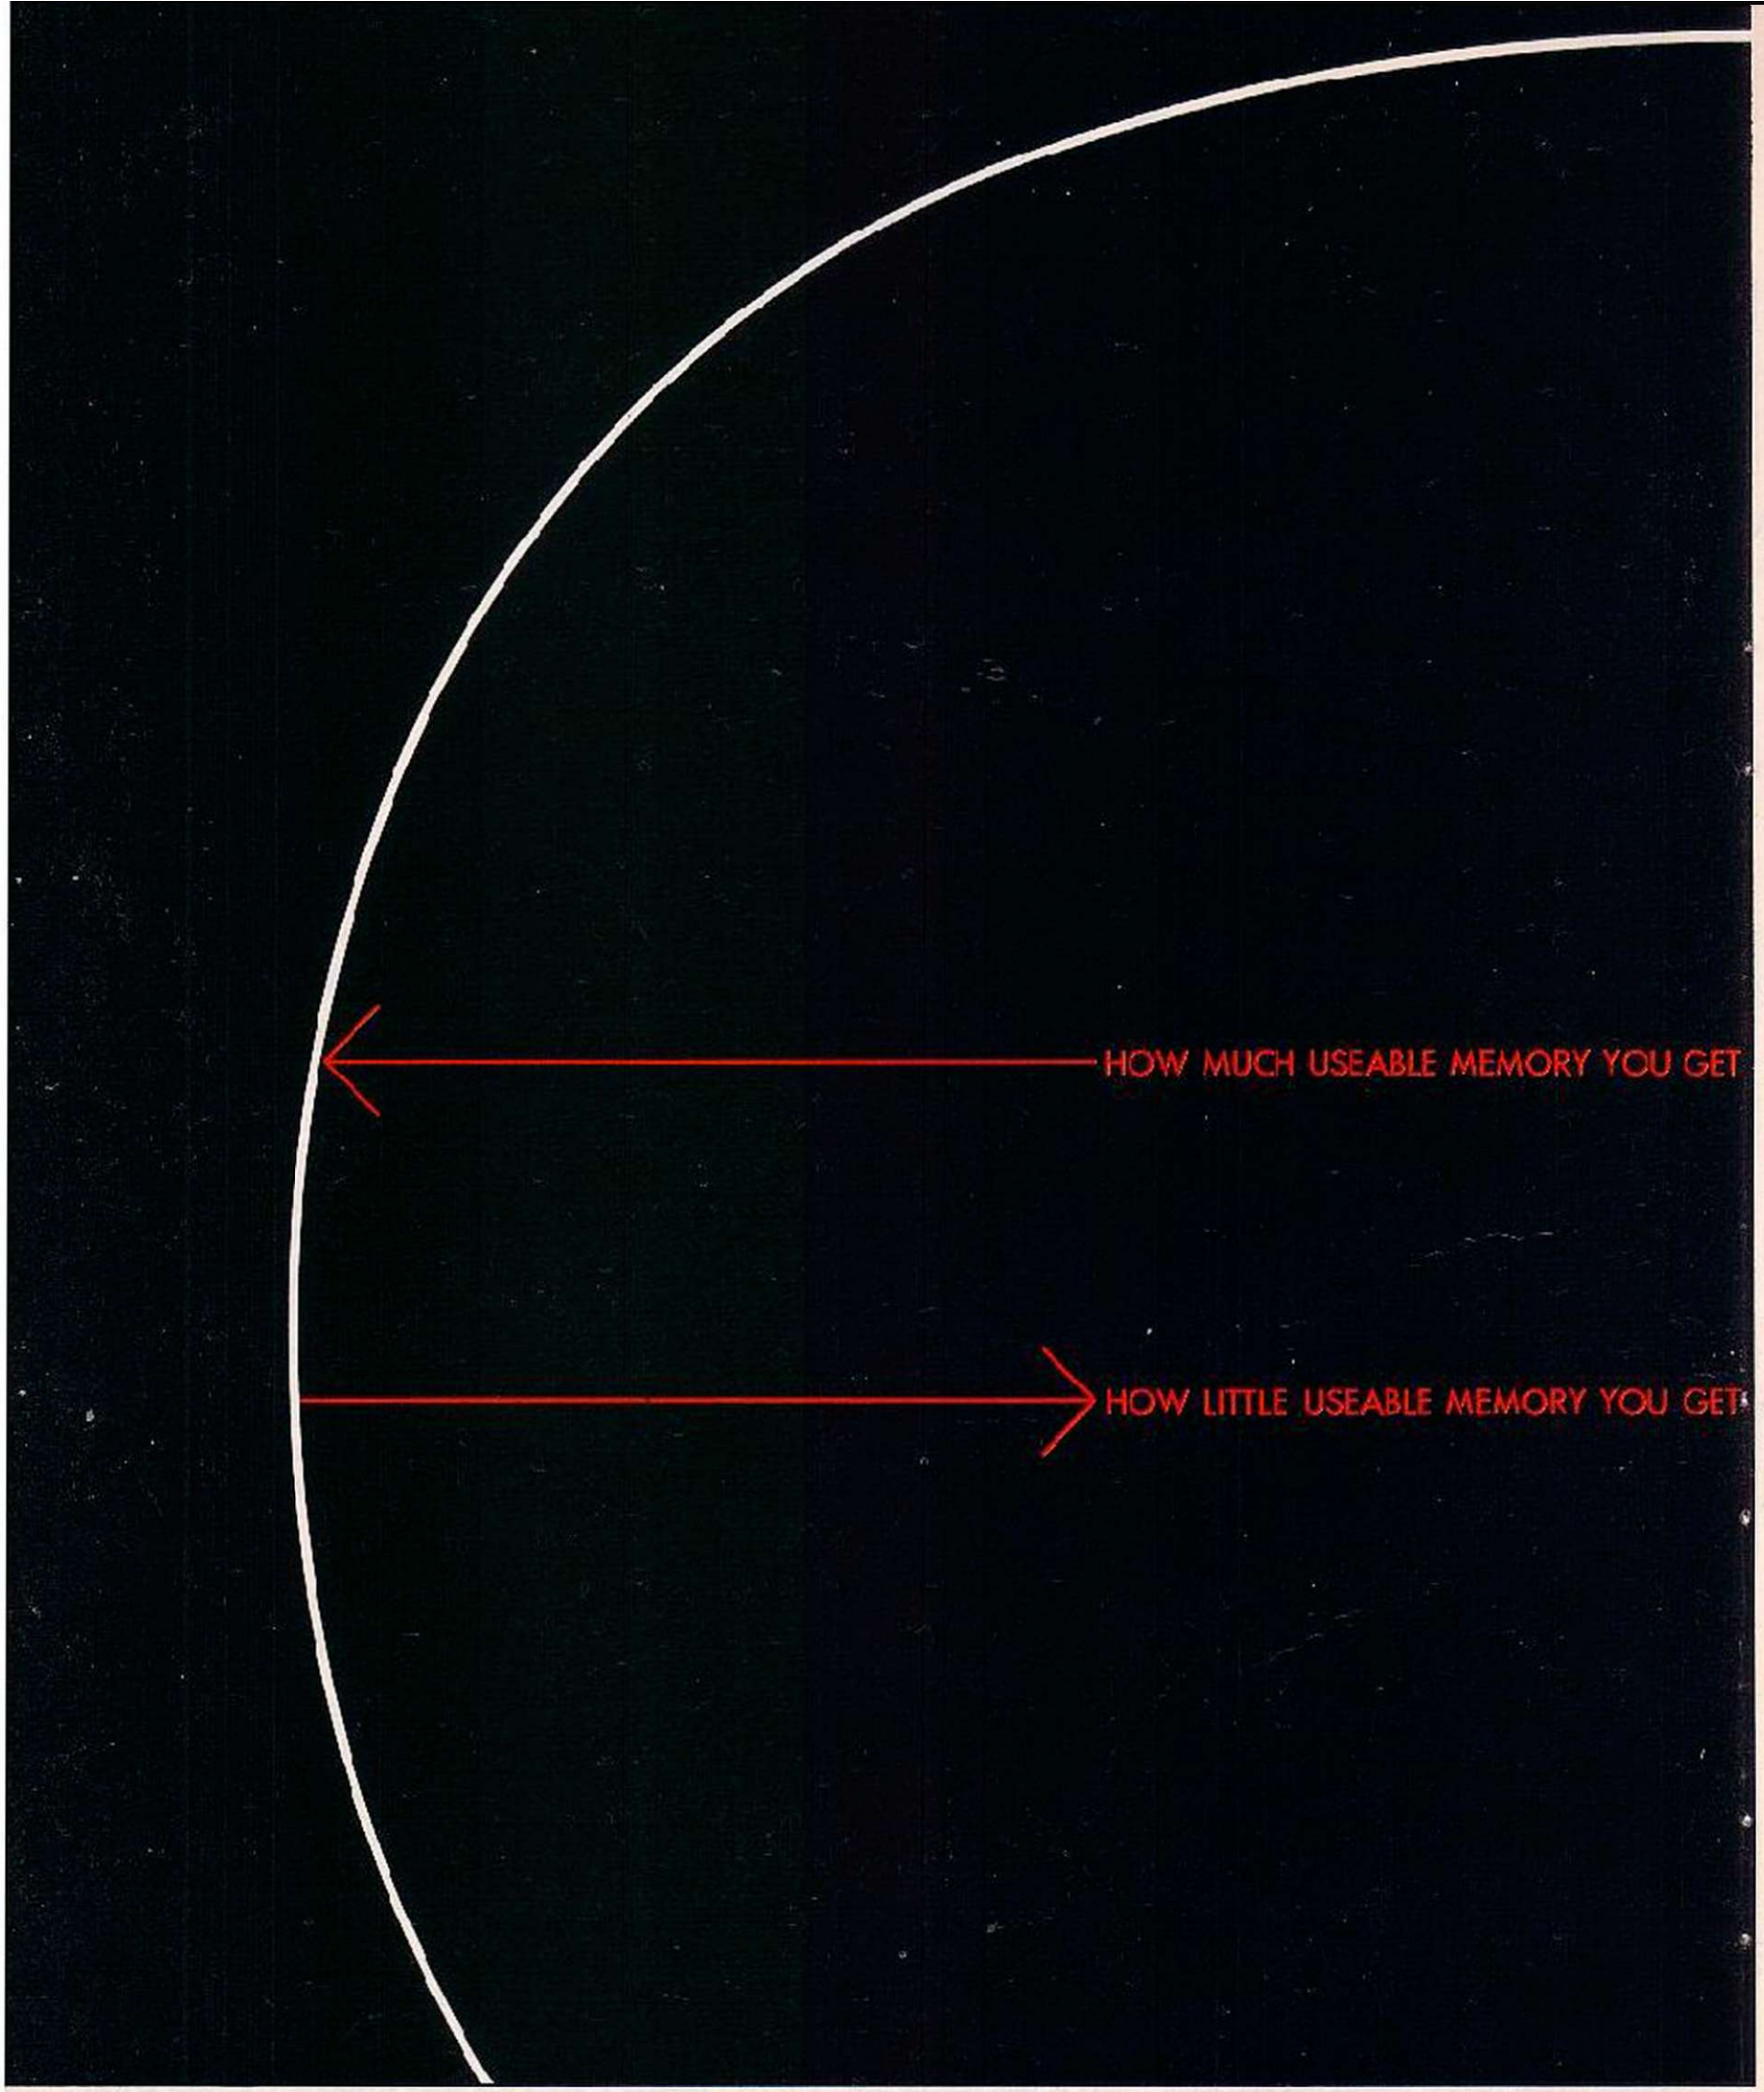
My Apple computer has been used now to write two books, each of 60,000 to 70,000 words, and any number of articles. If there are six characters in each word on average and if each book required 20 percent more typing than the final text, then the keyboard has handled at least 935,000 keystrokes and I expect that the articles have brought the total up to a round million.

There is still no sign of bounce or missed keystrokes in the Apple keyboard — obviously a reasonably rugged and well designed component.

My Epson printer has printed both the books and many articles several times as they progressed through one draft stage after another. The printer seems fine after several million characters — a remarkable piece of engineering.

Clearly you should not expect this kind of life from a computer and its peripherals at the cheap end of the domestic range. If one or two of the keys are used heavily for playing games, for example, then the keyboard may fail earlier than you would otherwise expect.

(continued on page 75)



Like humans, computers have memories.

Unlike humans, their memories shrink when they work.

Simple functions like colour, sound, text and high resolution graphics use up large amounts of memory, leaving little for you to play with.

For example, the Commodore claims an "elephantine" 64K memory, yet loses 26K in high resolution graphics.

Under the same conditions, the Dragon 32K leaves 24K of useable memory, the Lynx just 14K.

And the Acorn Electron and BBC Micro leave a miserly 9K to play with.

However, there's one computer specifically designed to take all these working functions in its stride.

The Oric Atmos 48K.

Even when you plug in its sleek, new, matching four-colour printer and micro disk drive unit, its useable memory is never less than a healthy 37K.

So once you've mastered the basic techniques,

AVAILABLE AT ALLDERS, CURRYS, DIXONS, GREENS, HARRODS, LASKYS,

WITH THE NEW ORIC ATMOS.

WITH OTHER HOME COMPUTERS.

you'll have plenty of memory to expand into advanced programming and extremely sophisticated games.

What's more, at full volume, the sound on the Oric Atmos competes with most arcade games.

So you can PING, ZAP, SHOOT and EXPLODE until you frighten the aliens to death. All for just £170, including all the leads and adapters.

Available at WHSMITH Boots WOOLWORTH John Menzies and leading multiple retailers and specialist computer stores

(continued from page 71)

Assuming that you decide to chance the state of wear of some second-hand equipment, where would you go to buy? Well, most of the computer and electronic magazines have a classified advertisement section but that always seems a little dangerous to me.

If you are sure that you can spot faults and find an honest seller then good luck. But remember that some faults show up only when the computer has been running for some time; others are intermittent and may occur only in certain combination of circumstances.

As an alternative to buying privately, there are a number of shops selling used computers; either domestic or commercial machines. The Morgan Camera Company, for example, is in Tottenham Court Road, London — 01-388 2562 — and from dealing in used cameras, the shop has expanded into buying and selling second-hand computers.

The current second-hand list is displayed on a blackboard outside the shop and there is a separate list inside for new and ex-demonstration computer equipment.

The people running the Morgan Camera Company say that they could sell far more computer equipment than they are able to buy, even for cash. However, unlike people selling cameras, the people who come to the shop with computers that they wish to sell often have unrealistic expectations of the price it will fetch.

Second-hand prices

The shop expects to add 30 percent to the buying-in price and 15 percent VAT has to be added to that before the final figure is reached. In return for the 30 percent mark-up, the shop checks that the machine is operating correctly, more necessary in some machines than others, and then guarantees the equipment for 30 days after the sale.

Some machines hold their value much better than others. A BBC model B, for example, can sell for £325 including VAT — new price £399 — while the Jupiter Ace can be had for as little as £15.

Other prices which are more or less typical are:

Commodore 64	£139
Acorn Atom	£40
Lynx	£115
Dragon	£65
Newbrain A	£103
Newbrain AD	£110
Spectrum	£99
Epson HX-20 with Microdrive	£325
PC-1500	£65
with printer and cassette unit	£75

Other companies deal in minicomputers such as the DEC range and more sophisticated peripheral devices. For example, Electronic Brokers Ltd, in Kings Cross Road, London — 01-833 1166 — carries a wide range of DEC central-processor units, memories and input/output devices. The DEC systems sold by Electronic Brokers are reconditioned and tend to cost a lot of money. Nevertheless, they offer enormous computing power at comparatively low prices.

Display Electronics, Biggin Way, Upper Norwood, London — 01-679 4414 — also carries a wide range of surplus commercial computing equipment. Provided that you know how to connect it to your own machine, you might find good value, for example, in a Termiprinter, a 30-character per second, 120-column RS-232 interface printer, sold untested for less than £100.

P.R. Ralfe Electronics — 01-723 8753 — has offered 8in. Winchester disc drives in the last four months for as little as £250 plus VAT. The drives have a capacity of 19 Megabytes and are said to be brand-new — a remarkable cost/bit ratio — about 69,000 bytes per pound!

The P&R Computer Shop — 0621-57440 — has IBM Golfball printers from £70 plus VAT, but just what state that printer would be in and how much work you would have to do to connect it successfully to your own system is another matter entirely. But if you don't ask, you'll never know.

The instruction manuals are a vital part of any purchase. However poorly written they may be, an instruction manual contains a vast quantity of information that you will find great difficulty in acquiring from anywhere else. The Morgan Camera Co. emphasises that it will only pay a "top" price for a computer if it is complete with the instruction manual.

Books about a computer may well contain new and additional information to that found in the original instruction manual but are unlikely to repeat the boring but essential facts about which pins are connected to what in the printer interface.

Manuals are particularly important if you buy an older piece of equipment such as the Calcomp 565 plotter — Stewart of Reading, 0734-68041. A new A4 flat-bed plotter which will connect directly to an RS-232 interface and has some built-in intelligence might cost between £500 and £2,000.

The Calcomp plotter on the other hand, is a beautifully engineered drum plotter that will maintain its accuracy to +/− one division — 1/100 of an inch — over not only the width of the paper but also the length of the paper roll — 120 feet! The problem, and the reason why the Calcomp 565 can be bought for £165, is that there are only six things that the plotter can do:

- Pen up — pen down
- Carriage left — carriage right
- Drum up — drum down

Additionally the inputs to the plotter are not directly compatible with the usual TTL signal levels on the outputs from modern micro-computers. The Calcomp requires at least 10 volts at 20 mAmps.

The six basic movements are those of any XY plotting system without the high-level character plotting and line-drawing software that you or I would tend now to take for granted. If you know enough to write the software and construct a computer TTL-Calcomp interface, this equipment can be superb value, but you will need a complete instruction manual.

Apart from Osbornes, Apples and Atoms, the Morgan Camera Co. has less mainstream computers at very attractive prices. If you want to do some real Basic computing, the Sharp PC-1500 pocket computer with its four-colour printer/plotter and cassette interface is remarkable value.

This machine fits into part of a briefcase, has a reasonably standard Microsoft Basic interpreter, comes with 3.5 or 11.5 Kbytes of RAM, can handle two-dimensional arrays, and has 18 user-definable keys, a continuous Time statement and all sorts of other useful things.

The printer/plotter uses the same pens as the Oric/Tandy plotter although the paper is somewhat narrower. Programs can be Chained and arrays of data can be saved directly on to tape with a single instruction.

The listing shows a program that synthesises a wave-form from a fundamental frequency and up to 10 harmonics of various amplitudes. The third trace shows how third, fifth, seventh and ninth harmonics can be combined to produce a wave-form that is beginning to like a square wave.

Good value Atom

By contrast, the fourth trace shows the result of combining even-order harmonics. The Sharp plotter would have produced finer resolution if I had set the Step instruction in lines 5110 and 5230 to one-degree intervals instead of five.

You should be able to reproduce this program on an Oric or a BBC computer keeping the following notes in mind:

GLCursor — 105, −400 — moves the pen of the plotter to the absolute co-ordinates X = 105 and Y = −400 without drawing a line.

SCRGN — sets the origin of the plotter to the current coordinates.

Line — −50, −6 — −50,0 — moves to the absolute co-ordinates −50, −6 and draw a line to −50,0.

Line — A,G — draws a line from the current pen position to the absolute coordinates A,G.

Pause — works like the Print command but waits for a fixed time of about 0.8 seconds. This is useful on the Sharp which has a single line display.

"S", "H" are labels that can be used with Gosub instructions, for example, or with the definable keys to isolate program segments that can be run separately.

LF — line feed. The succeeding number sets the number of line feeds to be sent to the printer.

Wait sets the time that the Print instruction will display messages or results on the computer screen.

The Status commands at the end of the program report the number bytes taken by the program, 1, and the remaining space, 0, in the 3.5K configuration.

The Sharp PC-1500 has no Auto or Renumber instructions and no Procedures or Eval function. Nevertheless, it has good error messages, TROn and TROff facilities for tracing program execution and is generally a clean and economical Basic interpreter. It is very usable and the printer/plotter adds both to the fun and the utility of this tiny machine.

Probably the best value of the second-hand computers that I have seen is the Acorn Atom for £40. Expandable, with a fast Basic interpreter, a built-in assembler and a reasonable software base, it is a machine that has simply gone out of fashion.

Consequently, it is less than half the price of a second-hand Spectrum and yet has a real keyboard and far greater potential.

MICROPOWER MICROPOWER MICROPOWER

ANSWER BACK SENIOR QUIZ

GENERAL KNOWLEDGE

THE ULTIMATE EDUCATIONAL QUIZ FOR AGES 12 & OVER

BBC (32K)•ELECTRON

The ANSWER BACK Quiz provides an incredible adventure in education by combining a compelling Space-Age game with an immense series of questions on General Knowledge. The thought-provoking and well-researched quizzes contain an enormous total of 750 questions with 3000 answer options covering the following subjects:

☐ Astronomy ☐ Music ☐ Natural History ☐ Famous People ☐ Science ☐ Sport ☐ History ☐ Art and Architecture ☐ Know your Language ☐ Discoveries and Inventions ☐ Legends and Mythology ☐ Geography ☐ Literature ☐ Films, TV and Theatre ☐ Pot Luck

The highly sophisticated control program rewards each correct answer with another turn in the colourful, animated game.

FEATURES INCLUDE

☐ Multiple choice answers ☐ True or False? ☐ Find the missing letters ☐ "Pass" facility ☐ Immediate correction of errors ☐ Timer option ☐ Performance summary ☐ Re-run of questions passed or incorrectly answered ☐ Full facilities for creating and saving an unlimited number of new quizzes

Available from your computer store or by mail order. Price £10.95.

AVAILABLE SHORTLY:
ANSWER BACK
Junior Quiz
for the under 11's

Other educational titles include...
'The French Mistress'
'The German Master'
'The Spanish Tutor'

DANGEROUS GARDENS

Jason Charlesworth in a fight to the death.

DANGEROUS GARDENS is a game for the 16 or 48K ZX Spectrum which squeezes every ounce from the Spectrum's various features.

Listen to the music at the start of the game. Credit is due to Robert Rhodes who translated the music to Spectrum beeps.

The object of Dangerous Gardens is to rid the five gardens of the creepy crawlies which inhabit them. The problem is that the whole of the garden is radioactive — that's why the plants and animals have mutated and grown so big — and so touching anything results in the loss of a life. However, you are protected by your trusty spray-can.

This spray-can fires in the last horizontal direction it moved. Shooting a sparrow is worth 10 points, a snake 20 points, a spider 30 points, a butterfly 40 points, a wasp 50 points and shooting a widget — the bouncing creature — is worth 99 points. Each of these animals — with the exception of the widget — is featured in one of the five screens.

To set up the game, type in the short Basic listing and save it with:

SAVE "Dangerous" LINE 1

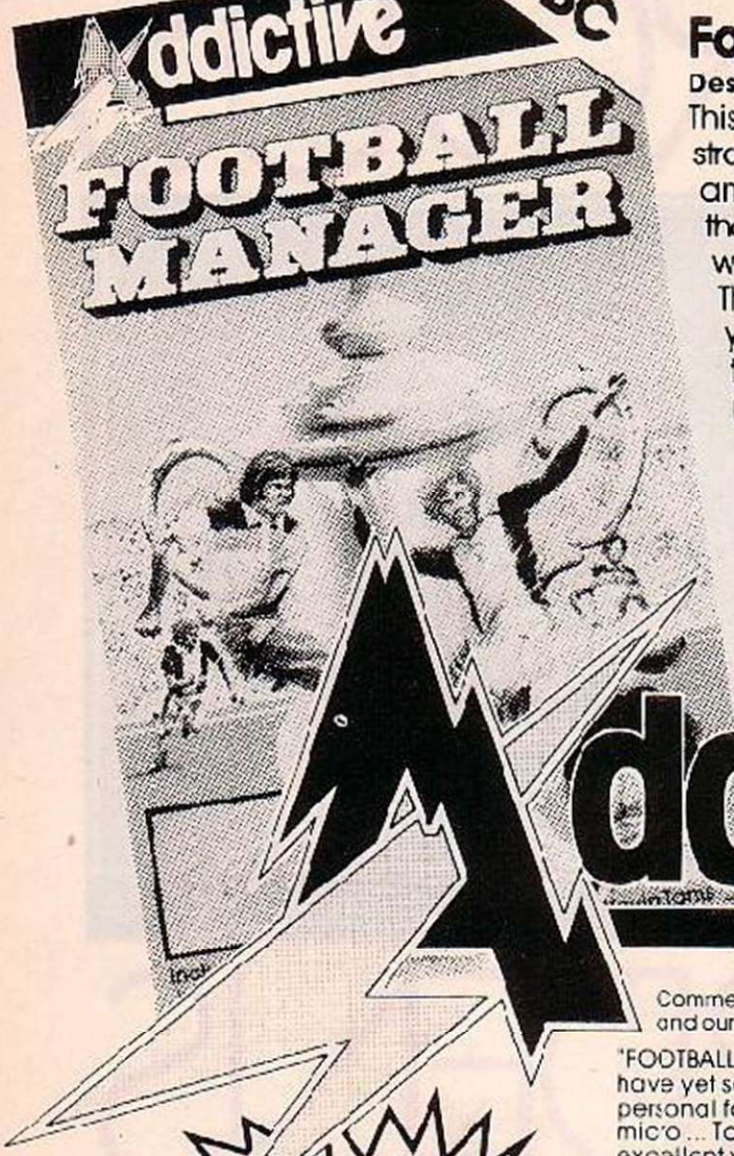
The No.1 Football Game*

Now available for the BBC model 'B'

BBC Model 'B', ZX81 16K, ZX Spectrum 48K



Football Manager

Designed by Kevin Toms

This outstanding game of skill and strategy is now widely available and you can join the many thousands of satisfied customers who have purchased the game. This is no five minute wonder – you will be playing this game for hours over many weeks (we know – our customers tell us!).

Kevin Toms

Some of the features of the game:–

- ★ Matches in 3D graphics
- ★ Transfer market
- ★ Promotion and relegation
- ★ F.A. Cup matches
- ★ Injury problems
- ★ Full league tables
- ★ Four Divisions
- ★ Pick your own team for each match
- ★ As many seasons as you like
- ★ Managerial rating
- ★ 7 skill levels
- ★ Save game facility

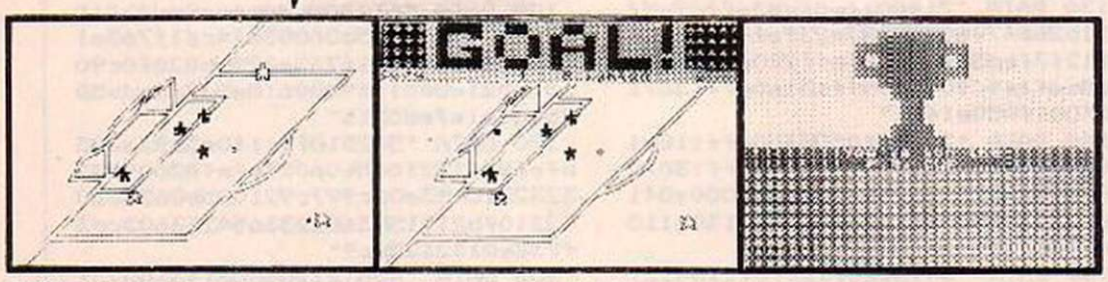
Comments about the game from press and our customers

"FOOTBALL MANAGER is the best game I have yet seen on the Spectrum and my personal favourite of all the games on any micro ... To the ordinary person it is an excellent view of what can be done in the field of computer games ... The crowning glory of this game is the short set pieces of match highlights which show little stick men running around a pitch, shooting, defending and scoring ... It is a compulsive game but people who cannot take game sessions of 9 hours or so, which happened on one happy Sunday, will be grateful to know that there is a 'save to tape' option. FOOTBALL MANAGER has everything it could ... The originator, Addictive Games, certainly deserve the name." Rating: 19/20 (Practical Computing – August 1983).

"When I first received this game I spent the best part of the weekend playing it. Since then I have returned to it more often than any other. The truly addictive quality of this game is the remarkable way it mirrors the real football manager's problems ... "(Personal Computer Games – Summer 1983)



Action from the Spectrum version

Versions coming soon for

Commodore 64

Dragon, Oric

and Atmos.

"I am writing to say what a great game it is. I have spent over 45 hours on it." (Mr. D. Fearn – Gloucestershire.)

```

(continued from page 79)

l and run it. Save it to tape directly after Dangerous:

SAVE "CODE1" CODE 30335,2432

This then needs to be repeated for listing 2 except the code needs to be saved after Code 1:

SAVE "CODE2" CODE 30000,2240

These two blocks of code must now be combined into 1 block of code so type

RANDOMIZE USR 0

Rewind to the start of Code 1 and:

CLEAR 28099:LOAD "CODE1" CODE 28100:LOAD "CODE2" CODE 30532

SAVE "CODE" CODE 28100,4667

To run type Load " ".

Listing 2.

JET MAN IS A game for unexpanded Vic-20 and a joystick. The game comes in five parts, the first three set up the machine code, the fourth is for the graphics and the fifth is the Basic part of the program. The game itself is mainly machine code, and has 10 different speed levels. At the start of the game you are faced with five bars running across the screen, in these bars are spaces which move, and you have to guide Jet Man through them, but be careful, as you only have one Jet Man.

When you reach the top of the screen you then have to touch the switch at the top left, this then switches off the generator which supplies the energy to the Whizzers which move along between the force fields, and these will kill Jet Man if he is moving and they hit

him, but they will not kill him if he is standing still.

Sometimes Jet Man can survive a collision with a force field, but not too often. Jet Man has one defence against the Whizzers, these are small rotating bombs which he can lay in the path of the Whizzers and if a Whizzer hits one it is destroyed, but another Whizzer appears at the left hand side of the screen. Jet Man has an infinite supply of these bombs.

At the bottom of the screen is part of a plane from where Jet Man starts from, and at the bottom left is the generator which supplies the Whizzers with their energy.

In the machine code is an interupt to control the spinning of the Whizzers and one to read the joystick.

Each of the first four programs which set up the machine code and graphics has two check sums. The first check sum is to check that all of the data is correct, and the second is to check that the number of zeros is correct. If the data is wrong then you will get a data error, or if the number of zeros is incorrect then you will get a "too many zeros error", or a "zero missing error", in this case you will have to re-check the data.

After each loader has been run you will then be asked to load the next part.

Main game.

CRUSADER

NEW SPECTRUM KEYBOARDS...

Interface 1 Compatible
6 Convenience Keys
inc. **Full Size Space Bar**
22 AUTOSHIFTED Special Function Keys

WOKING COMPUTER CENTRE
32 Chertsey Road, Woking, Surrey.
Telephone Woking (048 62) 23845
Trade enquiries welcome

Many customers have fallen for the classical good looks of the Emperor, its slim appearance, clean lines, the perfect typing height and the professional feel of the full travel keys.

Now we have added the CRUSADER to the range, identical in appearance but purpose built for the serious programmer, typist or business user. It is the same size, 14.5"x7.3"x2" fitted, in Ivory, but has a triple matrix featuring 22 AUTOSHIFTED function keys: all the microdrive command/ maths keys ÷ × = − + ≠ are together in the top right hand corner, main punctuation , . ; : " where typists expect them, autoshifted cursors, Caps lock, $, Graphics <, >, Edit and DELETE. We have retained the convenience keys, ⟲(7) ⟳(6), fire (0), double caps shift & symbol shift for easy access to the extended modes, and the full sized space bar.

We have also maintained: the easy fitting, you need 1 screw driver — and 5 minutes AND, for a quality keyboard, incredible low cost of **£59.95.**

Please send me Emperor/Crusader keyboard(s), £49.95/£59.95+£1.50 P&P
I enclose cheque/P.O./Access/Visa No.

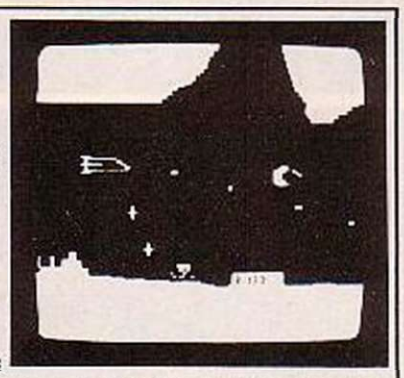
SLOGGER SOFTWARE

MACHINE CODE GAMES FOR **BBC 'B', ELECTRON, SPECTRUM 16/48K**

A MAZE IN SPACE



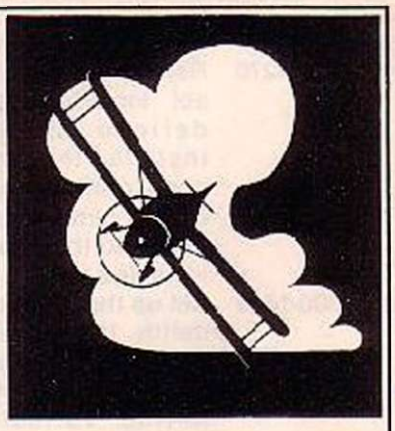
Use Joysticks or Keyboards to navigate your Starship to the planet surface and then into the maze below. Having been told in which section of the maze your target is hidden, your objective is to seek out and destroy it to complete a mission. Beware of the numerous alien defence systems. Two levels of difficulty! Horizontal and diagonal scrolling!
How many missions can you complete?

Available now	Cassette	Disc
BBC 'B'	£9.95	£11.95

Special Offer

Dogfight and A Maze In Space together
Cassette - £14.95 Disc - £16.95

DOGFIGHT



Still undoubtedly the most exciting 2-player game available. The objective is to fire sufficient shots into your enemy aircraft to force it to explode. Eight levels of difficulty. Sun, moving cloud, lightning, ground all provide real combat environment
Can you beat your friends?

Available now	Cassette	Disc
BBC 'B'	£9.95	£11.95
Electron	£7.95	n/a
Spectrum	£5.50	n/a

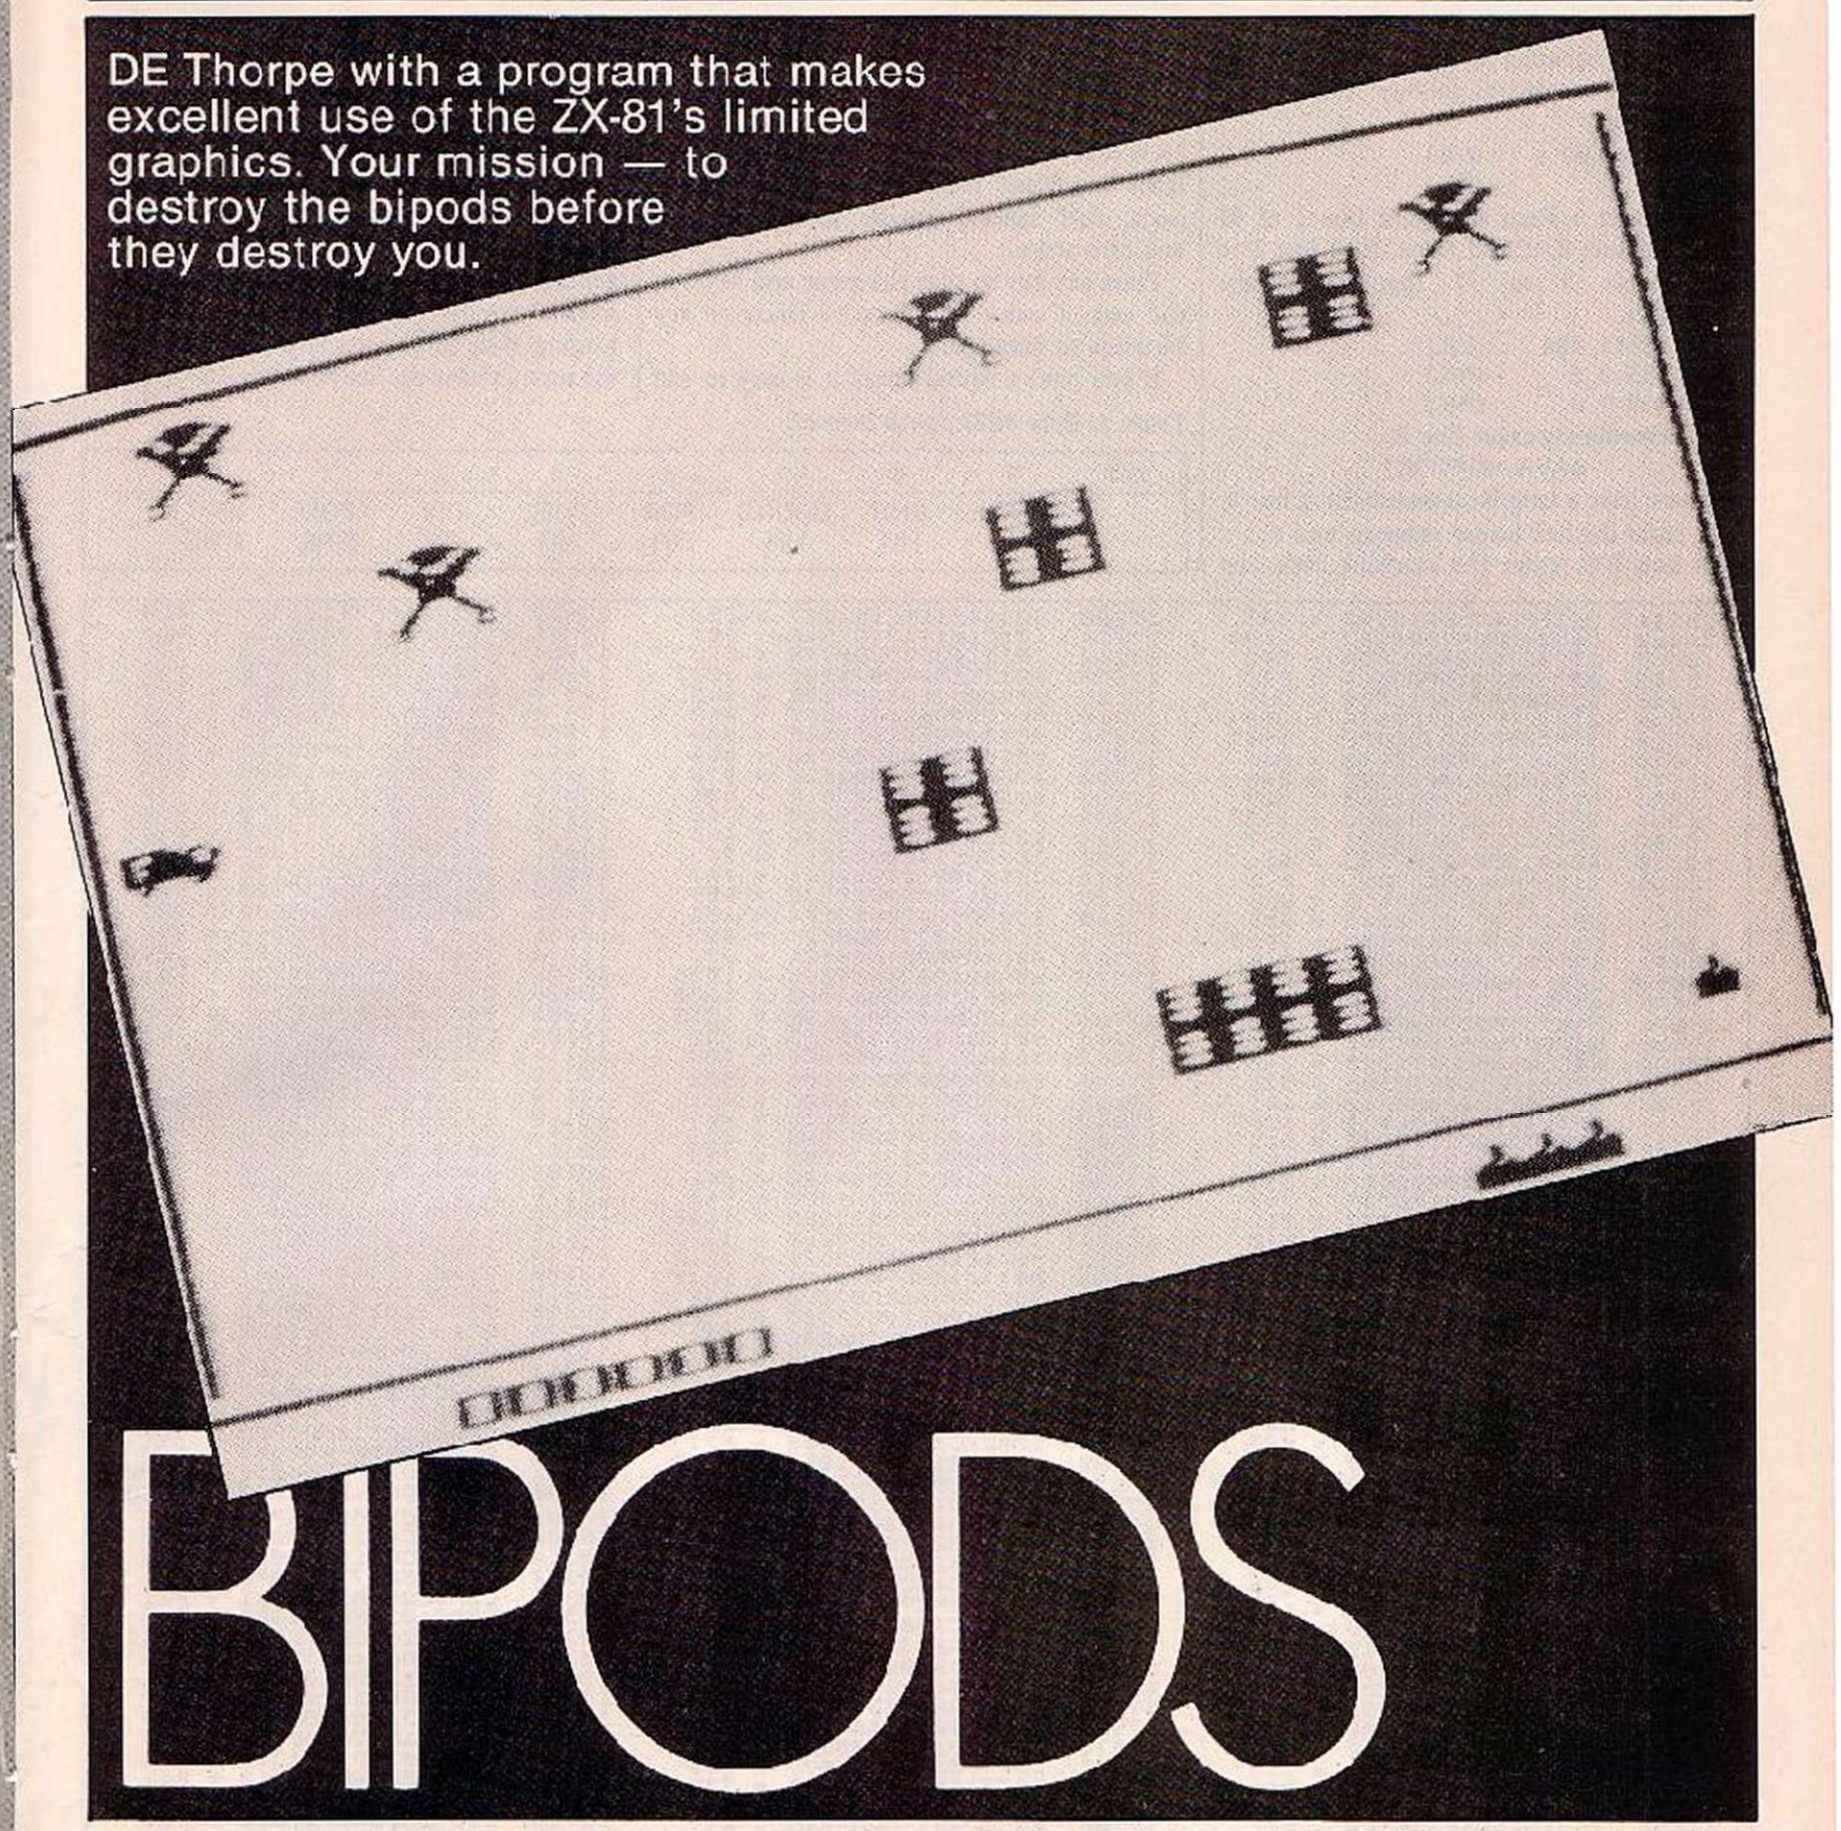
DE Thorpe with a program that makes excellent use of the ZX-81's limited graphics. Your mission — to destroy the bipods before they destroy you.



BIPODS

MARTIAN PODS HAVE landed in your battle zone. At first they are protected by force fields but to attack they divide into deadly Bipods. You must try to destroy them using a missile launcher controlled by the cursor keys.

Don't be too trigger happy — fire is 0 — since there may be a re-loading delay at a crucial moment. The missile launcher will move until the opposite key is pressed to stop or reverse it.

You score 20 points for a bipod and 10 points every time the fuel tanker successfully crosses the screen. There are bonus points at the end of each game level.

(continued on next page)

Hex loader.

```
  99 REM HEX LOADER
 100 PRINT "START ADDRESS"
 110 INPUT S
 120 PRINT "FINISH ADDRESS"
 130 INPUT F
 140 FOR N=S TO F STEP 8
 150 LET T=0
 160 PRINT N;" - ";
 170 INPUT A$
 180 PRINT A$;" = ";
 190 INPUT TOT
 200 PRINT TOT
 210 LET Z=0
 220 FOR K=1 TO LEN A$ STEP 2
 230 LET C=(CODE A$(K)-28)*16+CO
DE A$(K+1)-28
 240 LET T=T+C
 250 POKE N+Z,C
 260 LET Z=Z+1
 270 NEXT K
 280 IF TOT=T THEN GO TO 310
 290 PRINT "ERROR - PLEASE INPUT
AGAIN"
 300 GO TO 150
 310 NEXT N
```

(continued from previous page)

The game occupies just over 2K of machine code and is entered as follows: First, lower RAMtop by:

POKE 16389,90 (N/L)
NEW (N/L)

Now enter a Rem statement line 1 of 97 zeros and line 2 of 128 zeros. Edit line 2 to make lines 3 to 17 then enter the commands:

POKE 16511, 194 (N/L)
POKE 16512, 8 (N/L)
POKE 16510, 0 (N/L)

Now immediately enter line 2:

SAVE "BIPODS"

You now have a long Rem statement at line 0. Now enter the hex loader program and run it from line 100, enter the machine code and when finished, add the following Basic lines:

```
5 RAND USR 16592
8 STOP
```

Now save the program before running it. Run from line 5 and the screen should show the pods, fuel tanker, missile units, obstacles and zero score.

Press any key to start the game and key S at the end of game to return to Basic or key Newline to play again.

If you have a sound board it is easy to add sound to this game. There is space to add to your machine-code sound routines after the main program and these can be called from:

40d0 to set up the scund registers
4115 to produce the sounds.

The sounds to be produced are indicated by Bits being set in Byte 4021. After creating a sound the relevant Bits must be reset. If your generator uses the AY-3-8910 sound chip the sounds can be procuced simultaneously by loading Byte 4021 into Register 7 to enable the sound channels. See table 1. ■

Table 1: Byte 4021 comprises of:

BIT	7	6	5	4	3	2	1	0
	SPARE	UNIT HIT	BOUND HIT	POD HIT	FUEL HIT	DIV SIDE	POD FIRE	UNIT FIRE

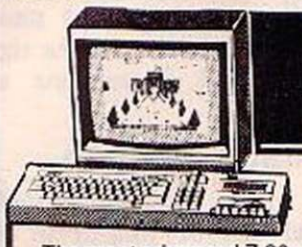
Kuma



AMSTRAD

ZEN 1.0 Editor/ Assembler/Debugger

The most advanced Z-80 code generating system available featuring Assembler, Disassembler, Editor, Machine code Monitor, and Debugger. Complete with full assembly listing. A full professional product.

Home Budget. A complete extensive home accounting system which takes care of forecasts/estimates of future expenditure/income.

Gems of Stradus. An amazing graphics adventure game

TATUNG Einstein

Wordprocessor, Communications, Databases, VAT Accounts, Expenses, Home Accounts, Arcade Games, Adventures, Entertainment, Educational, High level languages, Editor/Assemblers and much more.

Kuma — No. 1 for Tatung

Send for details.

SHARP MZ 700

Star Avenger £7.95, Cosmic Scramble £5.95, **Gunman £6.95** Chessman £6.95, **Breakthrough £5.95,** Super Space Invaders £6.95, **Quadrex £5.95,** Pinball Kirg £6.95, **Pelmanism £5.95,** Moonlander II £5.95. **Athlete £5.95,** Startrek Plus £6.95, **Cursed Chambers £6.95,** Speech Synthesis £14.50. **Books** The MZ700 Explained £5.95, Peeking and Poking the MZ700 £5.95. **. . . plus lots more**

EPSON PX-8

ZEN Editor/Assembler/ Disassembler

The first program to be released in our PX-8 Software Library **£45.43** **Phone for further details.**

EPSON HX-20

DM2 Word Processor £29.50, DM3 Spread Sheet Calculator £29.50, **DM9 RAM Database £29.50.** Tiny Pascal Compiler £39.50 **User Definable Graphics £17.50,** Home Budget £17.35, **plus a full range of books,** Phone for details

CASIO

DM2 — Wordprocessor £29.50, Machine Code Support Pack MCS P1 £86.25
DM6 — Decision Maker £19.95, Metric to Imperial Conversion £9.95
DM17 — Pert £29.50. For further details Phone **073 57 4335**

SIRIUS 1 apricot

Basic Tool Kit
Ten major sub routines
£97.75

commodore 64

BC BASIC **£57.50**
A complete 9K extension supplied in ROM pack

PAINTPIC **£19.95**
Drawing/Painting using a multi-colour bitmap

sinclair SPECTRUM

Frog Shooter	**£6.95**
Vegetable Crash	£6.95
Alien Destroyer	**£6.95**
Home Budget	£6.95
Logo	**£9.95**

SNAKY

M. North squirms his way around a Dragon's hires screen.

Basic loader.

```
5 REM HEX LOADER
10 REM TYPE PCLEAR8 BEFORE ENTERING THIS LISTING
20 FOR N=8001 TO 10877 STEP 8
30 SUM=0
40 PRINT N;": ";
50 INPUT A$
60 PRINT A$;"= ";
70 INPUT TT
80 PRINT TT
90 Z=0
100 FOR K=1 TO LEN(A$) STEP 2
110 C=VAL("&H" + MID$(A$,K,2))
120 SUM=SUM+C
130 POKE N+Z,C
140 Z=Z+1
150 NEXT K
160 IF SUM=TT THEN GOTO 190
170 PRINT "ERROR - PLEASE INPUT AGAIN"
180 GOTO 30
190 NEXT N
```

THE IDEA OF THIS game for the Dragon 32 or 64 in 32K mode is that you control a snake moving around the screen, eating grubs and beetles but avoiding the poisonous mushrooms. The snake is controlled by the right hand joystick and full instructions are included in the game.

Written in machine code

The game is written entirely in 6809 machine code and can be entered in the following way:

First type in: PCLEAR8

then type in the Basic loader and use it to enter the machine code directly into memory. At the first input prompt enter the string of hex digits and follow it with the checksum.

When the program is correctly entered save it by typing

CSAVEM "SNAKEY", &H1F41, &H2A7E, &H2566

Do not attempt to run the program before saving it since the checksum is not perfect.

If you find the game too easy or too easy, you might like to change the following addresses:

ADDRESSES	PURPOSE	DEFAULT	COMMENTS
&H25A8	initial no. of grubs and mushrooms	10	

Snaky machine code.

If you use computers at work or at home, Practical Computing magazine is essential reading. Every month it takes a long hard look at the most important issues in computing. It's informative, very useful and immensely readable.

It reviews both hardware and software, discusses the latest innovations and helps you get the most out of all the popular computers.

It's always entertaining, never dull. And it's at your newsagent now.

Practical Computing
At work. At home

SHOCK! HORROR! SCANDAL!

SHOCK! CITYATTAK. The seven screen, all action, machine code game. Superb graphics, smooth game play, a tough challenge for even the hardened arcade action addict.
Now available on disk.

HORROR! The journey of your life . . . or death! ODYSSEY. Described by Popular Computing Weekly as: 'Addictive with superb sound effects. An arcade game worthy of Jeff Minter for its pure speed of action!' Pick of the week (12th – 18th April 1984).
Now available on disk.

SCANDAL! IT'S ONLY ROCK'N'ROLL.
Your chance to succeed where millions of hopefuls fade. To make the big time in 'Showbiz' and show the world that you're a superstar, not just another dreamer.
Now available on disk.

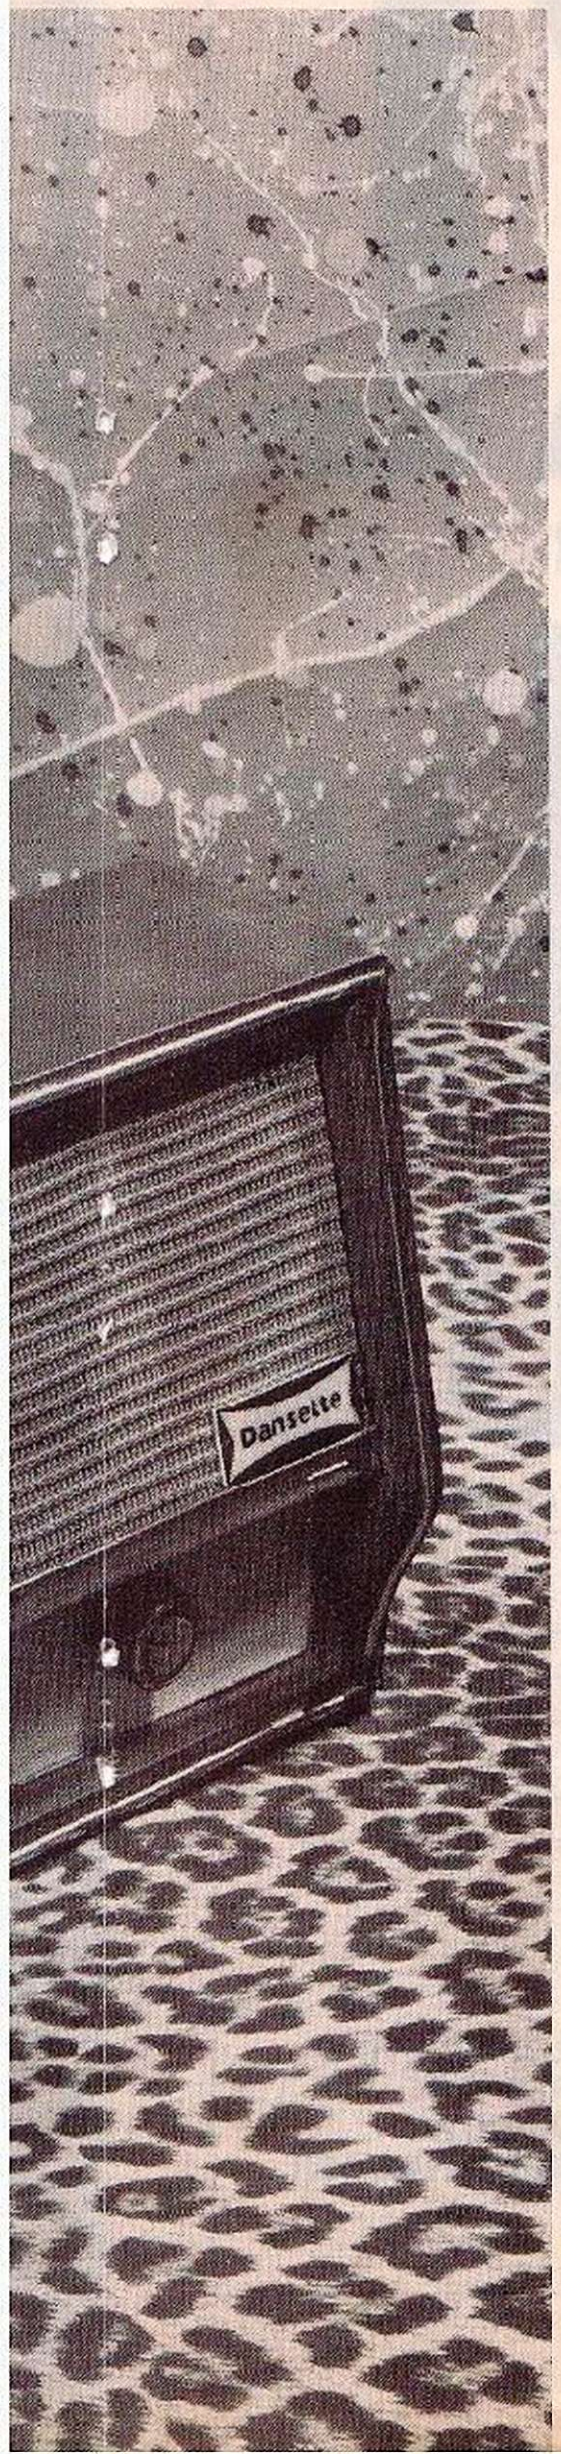
K-tel Software is available at:

Larger branches of John Menzies, Boots, and Computer Dealers nationwide.

K-tel Software can also be obtained by sending a cheque or postal order made payable to:– K-tel International (UK) Ltd. At 620 Western Avenue, London, W3 0TU. Allow 28 days for delivery.

Amazing how played out some things b

gs become.



Will you think the same of your micro in 6 months' time?

Remember the days when every record player was gifted with a needle instead of a stylus. 45's were "in," 78's were "out."

Before the days of hi-fi and laser discs. When a graphic equaliser was a breakthrough on the football pitch instead of in music technology.

Look at a record player now and it's a museum piece.

It's like that with micros too. The machine you thought would give endless hours of fun and interest often becomes a five minute wonder. Played out within months. Or so you thought.

But imagine communicating with other micro users on a nationwide mainframe system. Updating yourself daily with the very latest computer news and reviews. Paging a special Bulletin Board. Feasting from Prestel's vast menu. Even downloading a choice of software *absolutely free.*

In fact, imagine 30,000 pages at your fingertips and you've imagined what it's like to be on line with the Micronet 800 system.

For Just £13 a quarter (and, for most of you, a local telephone call whenever you want to connect up) you could subscribe to the Micronet system.

The only extra you need to connect up is a modem unit. Which is a small enough outlay for what it buys.

Micronet's features are almost limitless and constantly updating so why not see it in action at John Lewis stores, selected W. H. Smith shops and Spectrum UK dealers.

Or fill in the coupon for our brochure.

You'll find you won't want to play on anything else.

Please send me the full facts about Micronet 800.

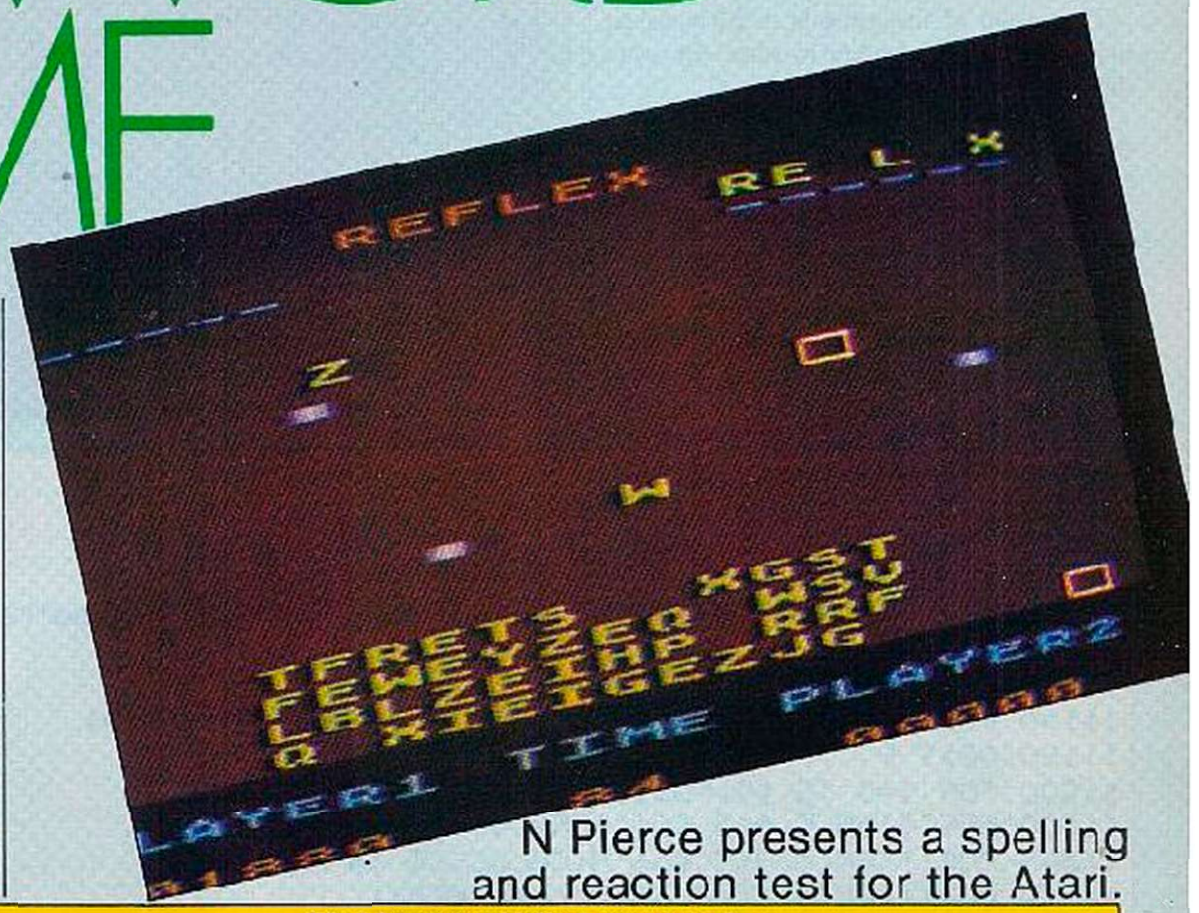
THE WORD GAME



N Pierce presents a spelling and reaction test for the Atari.

WORD GAME WILL run on a 16K Atari computer.

In the listing supplied:

- underlined words should be in inverse video,
- the character £ should be a #,
- Rem statements need not be typed.

The program uses a relocatable machine-code routine which is executed during part of the vertical blank interrupt procedure.

It uses memory locations 203 to 209 in page 0 and 1536 to 1586 in page 6 to hold control variables.

Briefly, its function is to: control player-missile images, cause the two cursors to flash, read and act upon input from joysticks 1 and 2, generate a periodic buzz on sound channel 3, and detect player-missile collisions.

(continued on next page)

(listing continued on next page)

(continued from previous page)

The two flashing cursors are moved by using joysticks 1 and 2. To pick up a letter, position your cursor over the letter and press the trigger to drop the letter, press the trigger again. You can restart the game at any time by pressing the Start key.

The object of the game is to fill your six blank spaces with letters to form the word displayed at the top of the screen.

You must choose letters from the group at the bottom of the screen and carry them to the blank spaces; avoiding the missiles on the way. Points are lost if a missile hits your cursor or if you use the wrong letters. The first player to complete the word correctly gets bonus points.

The game lasts for 99 time units and the missiles gradually move faster as the game progresses. ■

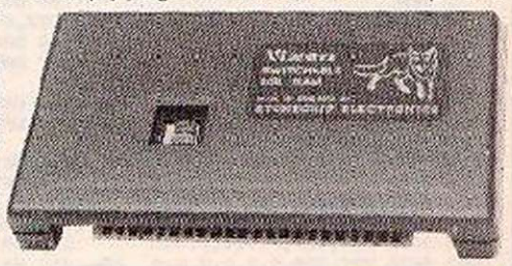
ADD-ONS FOR SPECTRUM, ZX81 AND VIC

The famous Panda Expandable RAM pack for the ZX81. Massive 16K add-on memory which can easily be expanded to a GIANT 32K with an optional plug-in MODULE. Rugged no-wobble design injection moulded case with integral LED power on indicator. No additional power supply needed, just plug on and go. British designed and built. Thousands in use. Prices: PANDA 16K **£19.95**. MODULE **£14.50**. GIANT 32K **£34.00**.

THE VIXEN SWITCHABLE RAM £34.95

16K RAM CARTRIDGE

The Vixen 16K switchable Ram cartridge is unique approach to expanding your VIC 20. Being switchable from either 16K to 8K + 3K programs already in use based on the unexpanded Vc 20 are not obsoleted. Supplied in attractive custom made case it simply plugs into the rear of the computer or motherboard. No additional power needed. High quality gold plated contacts ensure long trouble free life. Switches are recessed to avoid accidental operation. Designed and built in Britain. Guaranteed one year.



Spectravideo QUICK SHOT 2. JOYSTICK

The Most Popular Joystick, 8 position, 2 fire buttons PLUS Rapid-Fire switch. Left or Right handed index finger (Trigger Finger) and top-mounted Thumb operated Fire Button. Comfortable contoured ultra ergonomic Design. Built-in Stabilizing suction caps for impressive one-handed operation. Suitable for most computers with Nine way socket. VIC 20, Commodore 64, Atari, Spectrum (with interface) etc. £10.00 inc.

Programmable Joystick Interface. For the Spectrum

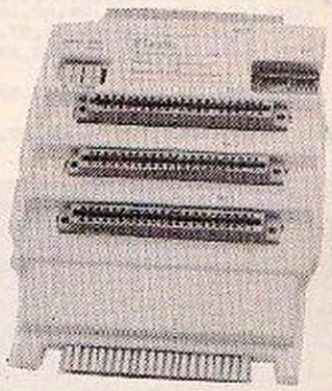
Use any game suitable for the Spectrum and simply program the Joystick to take control of the cursor and FIRE functions. Useable with any Joystick having the standard nine pin plug. Fits snuggly onto the user port of the Spectrum. Can handle 8 directions and even complex functions such as diagonal with fire etc. No additional software needed, simply plug in, program and play. **£24.95 inc.**

THE VIXEN MOTHERBOARD £31.95

THE EXPANDABLE EXPANSION SYSTEM. Providing 4 additional cartridge slots PLUS ROM socket. The slots are switchable enabling cartridges to be left in place and selected as needed by switching thus avoiding constant handling and the danger of breakage. Having one socket at the rear enables further expansion. Used in conjunction with one or more Vixen Rams full expansion can be achieved. ROM socket enables ROMs and Eproms to be fitted for future software programs, toolkits etc.

A range of ROM based software will soon be available from the manufactuiers. Industry standard Eproms, 2716,2732 etc are readily available and easily programmed and copied.

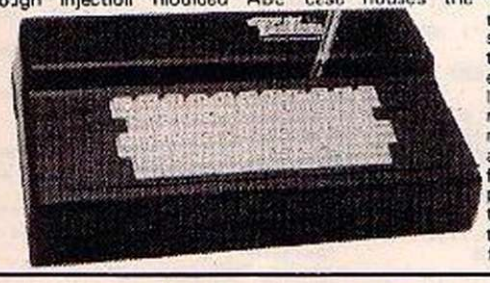
A sound investment for the serious user and serious games player which will not become obsolete.



PROFESSIONAL CASED KEYBOARD TYPE FD42. Models for the ZX81 and SPECTRUM

(PLEASE STATE WHICH)

The Fuller FD42 has long been our most popular seller. Its sturdy, attractive but very tough injection moulded ABS case houses the computer and converts it into a professional unit with 42 full size long-life computer-style full-travel keys. Keys are indelibly etched with ZX81 or Spectrum legends. No skills or soldering needed and full access is maintained to the user ports etc for add-ons. Power supply can be fitted inside. Has integral LED for power ON/OFF indication. In all a thoroughly worthwhile accessory to your computer. **£29.95** plus £2.00 postage and handling.



LIGHT PEN. For the VIC 20. This allows the user to draw and paint in colour on the screen. It is ideal for screen layouts, graphic designs or as a games aid. Screen layouts can be altered and erased as desired and the finished work can be saved on tape and reloaded for future use or editing. Excellent Horizontal and Vertical resolution with superb stability. The Pen works perfectly in the High Resolution Graphics mode, even though the resolution determined by your VIC 20 is only 1/4 Pixel. Supplied complete with software cassette and full instructions. **£19.95**

NEW! CASSETTE INTERFACE FOR THE VIC 20 AND COMMODORE 64

Interface your Vic with any cassette player. Don't be tied to one you have to buy. If your model has external motor control capability, this interface will also control the motor/start. Simple to use, supplied with leads and inexpensive. **£14.95 inc.**

SPECTRUM UPGRADES 16K to 48K

THE KIT — Fit it yourself, a beautifully packed and presented kit with complete (Really complete in the detail you need if you've never seen inside your computer) instructions. No soldering — no wire bending — no fiddly bits. Thousands in use. Everything you need to upgrade your issue 2 Spectrum from 16K to a full blown 48K. The really economical upgrade — in stock for swift despatch. **£24.00**

THE PACK — A sturdily packages 16K to 48K upgrade pack that simply plugs on to the user port and works immediately. Throughport so any other accessories may be fitted as before. No need to open the case, no unscrewing, no soldering, no need to invalidate your guarantee. Designed and built in Britain. Guaranteed. Supplied in handsome carton suitable for gift wrapping. **£39.95**

NEW!! Upgrade your ISSUE 3 Spectrum from 16K-48K. This kit is supplied with full parts and very comprehensive instructions as to how to upgrade your ISSUE 3. Due to the change in design of the issue 3 this has not been possible with previously available kits. Not for the complete amateur as it requires two simple soldered connections to be made, anyone who has soldered before or who has a friend can fit this quite easily though. **£26.50**

PRODUCTS ARE STOCKED AND USUALLY DESPATCHED WITHIN 10 DAYS.

```

IN THIS adventure game based on *Jack and the Beanstalk* you play the role of our intrepid hero Jack; your aim is to recover the three treasures held by the evil Giant who lives in a strange land up in the clouds.

The program uses a mixture of text and graphics to represent the locations and objects you find on your travels. Owners of the Currah MicroSpeech unit will be able to hear the Giant's thundering voice.

Each location is represented by its own subroutines where all the associated variables are set. These include a location description string, a Help message, and pointers to surrounding locations.

Commands are also handled by individual subroutines. These routines check various flags and later those affected by the command. Table 2 gives a complete list of available command verbs.

Objects are split into two groups — those which can be picked up and carried and those which can only be examined. Portable objects

(continued from page 100)

have a graphic representation which appears after Look and Inventory commands. Associated with each of these objects are three levels of description, for example: "bag", "money bag" and "a cloth bag full of gold coins". The first two forms are those that can be used in commands like Get Bag or Get Money Bag. The third is the response given by the program to the Examine command.

Some special commands are also implemented. These include: Save, Load, Inventory, Recap and Quit.

First type in listing 1. This creates 64 user-defined graphic characters which are used in the graphic representation of the portable objects. When this runs without an error message, save the resulting code either to tape by typing

GO TO 9990

or to Microdrive cartridge by typing

GO TO 9995

Now type in the main program, listing 2. What you do now depends on whether you are using a Microdrive or tape. With a Microdrive simply type

GO TO 9995

having inserted the cartridge with the UDG code already on it. With tape it is now necessary to re-load the UDG code saved by listing 1. Do this by typing

GO TO 9990

This will load the code and then Save/Verify both the Basic program and the code automatically.

If this task seems rather onerous then tape and Microdrive copies are available at £4.95 and £8.95 respectively from: Colin Carruthers, 22 Drylaw House Gardens, Edinburgh EH4 2UE. In addition, maps can be obtained from the same address at only £1.

Table 1. Variables.

l(n)	Array of flags and object locations.
m$(n)	Short descriptions of objects.
o$(n)	Standard descriptions of objects.
d$(n)	Verbose descriptions of objects.
e$(n)	Fixed objects that can be examined.
e(n)	Location of fixed objects.
set	Current location.
l$	Current location description.
h$	Current help message
up,do,no, so,ea,we	Pointers to surrounding locations.
i	No. of objects carried.
i$,a$,b$	Input line, command and parameter.
max	Maximum number of portable objects.
found,sp	Assorted flags.
n,m	General for/next control variables.
keys s$	Currah MicroSpeech variables.

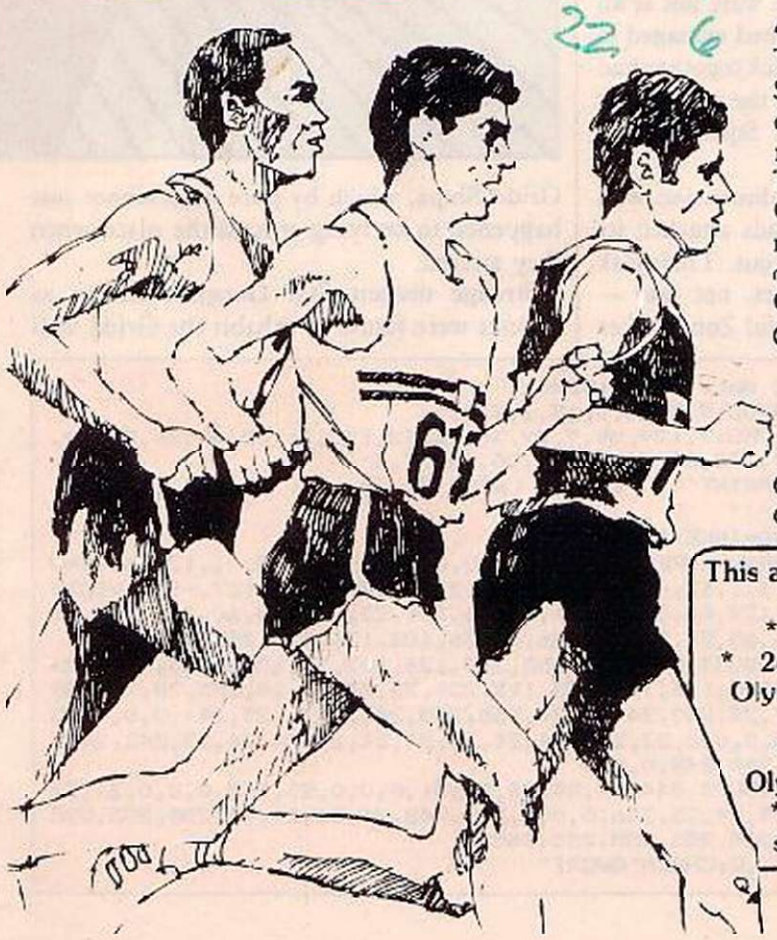
OLYMPICS 84



48k ZX Spectrum Commodore 64

To celebrate this summer's Olympic Games in Los Angeles, STORM SOFTWARE offers you an unique "two program" package. Crammed full of facts and figures - OLYMPICS '84 - gives great flexibility in looking at results.

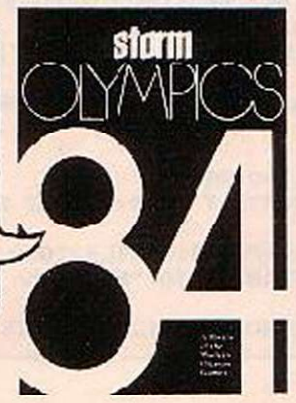
The first program details the medal winners, by country, in every current Olympic event since 1896. The second program enables you to record the name and nationality of each medal winner in Los Angeles; this information can be analysed and compared with the full result in the previous two Olympic Games.

OLYMPICS '84 offers many extra features:

* Bar-charts to compare performances over the years, in any event, including Men versus Women.
* Mecal tables, for any Year, Sport or Event.
* Ability to find a country's best sports and events.

OLYMPICS '84 package includes an amusing review of the Summer Olympic Games, from Athens 1896 to a preview of Los Angeles 1984.

This attractive package includes:
*** TWO programs**
*** 24pp History of the Olympic Games, with original sketches**
*** Every Summer Olympics since 1896**
*** A MUST for all sports enthusiasts**



Available from all good computer shops. In the event of difficulties, order direct at £14.95+50p P&P (inc. VAT). Dealers contact: Amanda Ralph or 0935 813528

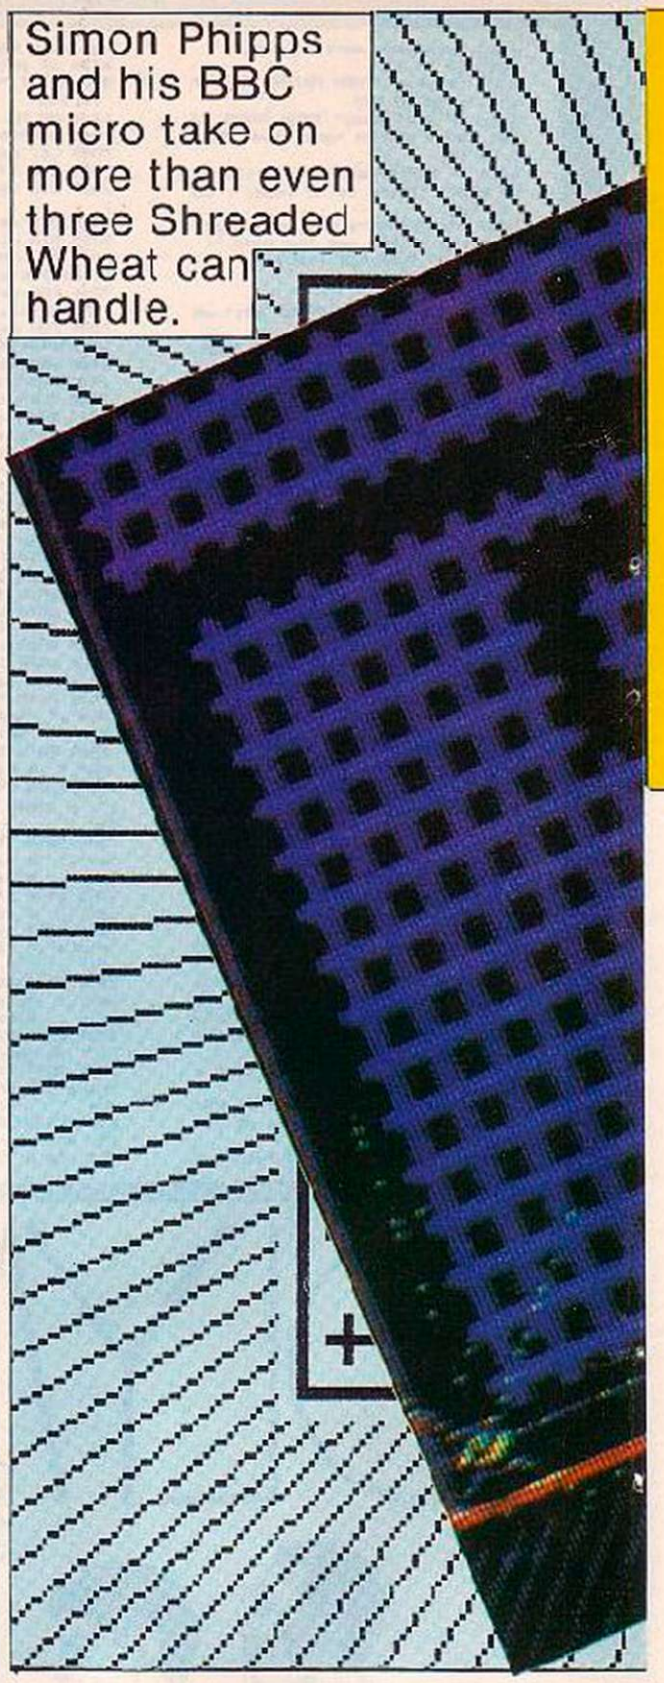
GRIDD WORZ

Simon Phipps and his BBC micro take on more than even three Shreaded Wheat can handle.



TIME ONCE MORE for your fingers to hit the keyboard as Simon Phipps, author of the recently released Jet Power Jack from Program Power, presents a space megaspectacular from his warped imagination. The game is a Basic and machine code original designed to tax both your brain — have you ever tried debugging assembler code? — and reflexes. Well, here we go . . .!

In the year 21867 man made a mistake. Not a very great one, not as big as deciding some several million years before to consider crawling out of the sea, but never the less it was for all intents and purposes a mistake. Some may have called it a great advance in the developments of psykinetics; the obscure branch of Vruggian metaphysics discovered by the equally obscure Earth scientist Professor Thruggon Botch, but still most called it a mistake.

The science of Psykinetic Transportation — or PT for short — was carefully studied by Professor Botch for many years and its true potential only realised after many experiments involving the passage of objects such as paper clips and biros into a strange dimension now named by most recognised physicists and loonies as the Meta Zone. The dimension exists in parallel with our own and is in fact responsible for many so called everyday occurrences.

Up until Professor Botch's discovery of the Meta Zone and the subsequent proof of its existence, anyone who had put forward ideas about parallel dimensionism was branded as suffering from severe paroncia or just generally laughed at.

The Professor's revelations at the discovery of the Meta Zone all related to a simple fact that everyone knows — when anything as small and important as that last paper clip is needed it always goes missing. He successfully broke the dimension barrier by carefully leaving a paper clip lying around and accurately monitored its position until it actually vanished.

By pure coincidence the moment that the paper clip ceased to exist as far as this Universe is concerned was exactly the same moment at which the Professor was looking for the aforementioned paper clip to hold his progress reports together.

Breaching the transdimensional barrier between our world and the Meta Zone in fact caused absolute havoc. Instead of simply enabling the return of all those missing biros and paper clips a gaping hole was produced in the dimension wall which began to suck up vast quantities of matter from our Universe.

It was quite a few minutes before some bright spark had an idea that would stop the chaos caused by the dimension warp. THREE Shredded Wheat were thrown in the general direction of the hole and immediately the havoc stopped. Of course even though the hole was well and truly plugged a few important things such as two-thirds of our Universe were at the other side of the Zone . . . whoops!

Inside the Meta Zone things were not at all hunky dory. What few people had managed to pull most of their molecules back together had decided to get out and so the amazingly trendily titled Zonetracker Squads were formed.

Finding a weakness in the dimension wall known as the Gridd, the squads attacked its structure in an effort to break out. Their task was, as with most video games, not easy — even with the aid of the powerful Zonetracker Gridd Ships, which by pure coincidence just happened to be lying around the place when they arrived.

Strange mutant Star Googjies known as Drones were found to inhabit the Gridd wall

and more such nasties appeared as the Zonetracker Squads disrupted sections of the Gridd and hence progressed to the higher energy Gridd levels. The Drones were highly advanced Meta beings whole sole purpose apart from being a general annoyance to everyone was to repair and eliminate any impurities on the Gridd which meant both short circuits and the Zonetrackers themselves.

The idea of the game is to pilot your Zonetracker across the Gridd wall destroying the individual Gridd sections. After approximately 75 percent of the Gridd has been destroyed the network explodes allowing passage to the next Gridd level.

Can you save the humans at the other side of the Zone from a fate worse than missing the next issue . . .? Start typing now!

Control keys for the Zonetracker are:

Z — Left
X — Right
? — Down
* — Up

Type in listing 1 and save it on cassette and then enter listing 2 and saving that under the title of "GWORZ".

The variable and procedure listing for listing 2 — Gridd VlorZ.

Integers

A%
30,250,330,520
General dogs-body variable, used in Inkey statements and FNPeek (x%,y%).

AX%
290,300,350,710
Value of the memory address at which the x co-ordinate values of the drones' positions are stored from.

AY%
290,300,350,710
Value of the memory address at which the y co-ordinate values of the drones' positions are stored from.

B%
330
Seems to have slipped into the program by mistake — spot the untidy programmer.

CO%
160,170,200,290,300,470,480
Number of Gridd sections left to be destroyed by the Zonetracker before the Gridd destructs.

CODE%
360,530
Value of the memory address from which the machine code is assembled into.

D%
710,750,780
Dogs-body variable used in PROCRND-CHAR(C%) and PROCRND.

E%
710
Simply used in PROCRND to select the value of the x co-ordinate increments or the chosen drone's x co-ordinate value.

H%
120,130,330
The value of the character representing the drones. This is constantly being altered to give the pulsing effect of the drones.

HI%
10,240,250
Value of the high score.

J%
1000,1010
Variable used to generate the explosion of the Zone tracker.

K%
420,430,1000,1010
Variable used in the same way as J% to generate the explosion and also as the new value of the y-increment on the Zonetracker's co-ordinates depending upon the keys pressed in FRCCSnake.

K%
40,170,210,480
Variable used to check if the Zonetracker has collided with anything.

L%
420,440
Variable used to determine the x-increment of the Zonetracker's x co-ordinate depending upon the keys pressed in PROCSnake.

LI%
40,210
The number of lives left.

M%
830,840
Used in FNBIN (a$) to determine the value returned by the functions.

P%
530
Program counter — where the machine code is being assembled into.

R%
830
For-To-Next loop variable in FNBIN (a$) which checks down the string passed to the procedure character by character.

S%
710,760
Dogs' body variable used in PROC RND and PROCRNDChar ic%).

SC%
750,780
String used in PROCRND Char (c%) to store the string returned by FNBIN (a$).

HI$
10,30,250,910,920,960,970,980
Name of the current highest scores.

a$
700,330,840
General dogs'-body string variable used in PROCedures and functions.

Reals

A

890

Used as the length of the side of the box in PROCBox (x%, y%).

ALIEN

100

Value of the address at which the drone initialisation subroutine is assembled from.

B

890

Used as length of side of box in PROCBcx (x%, y%).

C

520

Used in FNPeek (x%, y%) to store the value of the character at position x%, y%.

P

370

Variable used to read from the Data statement in line 380.

T

1000,1010

Dogs'-body For-To-Next loop variable used in explosion routine.

YUK

150

Value of the address at which the drone movement subroutine is assembled from.

Functions

FNBIN

780,830

Converts the binary string stored in a$ to a decimal value stored in that string.

FNMIN

710,720

Function converting the values of +1 and −1 to 1 and 2 respectively for passing on to the machine-code subroutine.

FNPEEK

300,470,520

Checks to see which character is present at the co-ordinate X%, Y%. This has been modified from the version in the User Guide to work with both OS 0.1 and OS 1.2.

Procedures

PROCASS

360,530

Contains the assembler code for the drone element movement routine.

PROCE

290,320

Places a shortcircuit at the co-ordinates dictated by X% and Y%.

PROCEOX

880,890

Draws a box of side T% as defined on being called. Note the y-axis side length is multiplied by 0.8 to produce a true square as seen by the viewer.

PROCCHARS

80,260

Calls up PROCRNDChar (c%) to define the drone characters — CHR$229 and CHR$230.

PROCDED

210,1000

Blows up the Zonetracker after it has collided with an object.

PROCEND

200,880

Disintegrates the Gridd after about 75 percent of it has been destroyed.

PROCGRIDD

90,1020

Redefines character 224 depending upon the number of Gridds completed.

PROCHIGH

240,900

Contains the input routine for the name of the high scorer.

PROCINIT

20,340

Initialises the main variables as used in the assembler code and calls PROCAss (o%).

PROCINITSCREEN

30,860

Prints up the title page.

PROCRND

140,710

Randomly selects a drone and changes the x and y co-ordinate increments in order that it may chase the Zonetracker.

PROCRNDCHAR

260,750

Randomly defines the character stored by the variable c% to design the drones — this way new drones are defined on each game.

PROCSC

480,850

Displays the score at the bottom of the screen.

PROCSCREEN

90,270

Draws out the screen at the start of play.

PROCSNAKE

150,410

Controls Zonetracker movement.

PROCVARI

100,330

Initialises the main variables for each new screen.

PROCW

80,200,240,250 700,900

Writes out the text passed it by A$.

COMPUTER LANGUAGES...

Imagine a ferret in a hardware shop

Not something you'd forget. That's how the Linkword System helps you remember that the Spanish for "hardware shop" is "ferreteria".

You'll remember that the French for "fish" is "poisson" by imagining poisoning your pet fish.

Using Linkword you'll learn over 350 words in only 10 hours, that's a quarter of the time it would normally take. Enough for holidays, business trips abroad or help with homework. Start from scratch, and it's amazing how quickly you learn a basic grammar and vocabulary.

Silversoft Ltd, London House, 271/273 King St, London W6 9LZ

Linkword courses in French, German and Spanish are now available from Silversoft for the 48K Spectrum home computer, and there are more to come soon.

They're the biggest thing in languages since the Tower of Babel.

To Silversoft Ltd, London House, 271/273 King St, London W6 9LZ. Tel: 01-748 4125

Please send me _____French _____German _____Spanish Linkword courses at £12.95 each plus 50p P&P.

I endose a cheque/PO for £_____ payable to Silversoft Ltd, or please debit my Access card

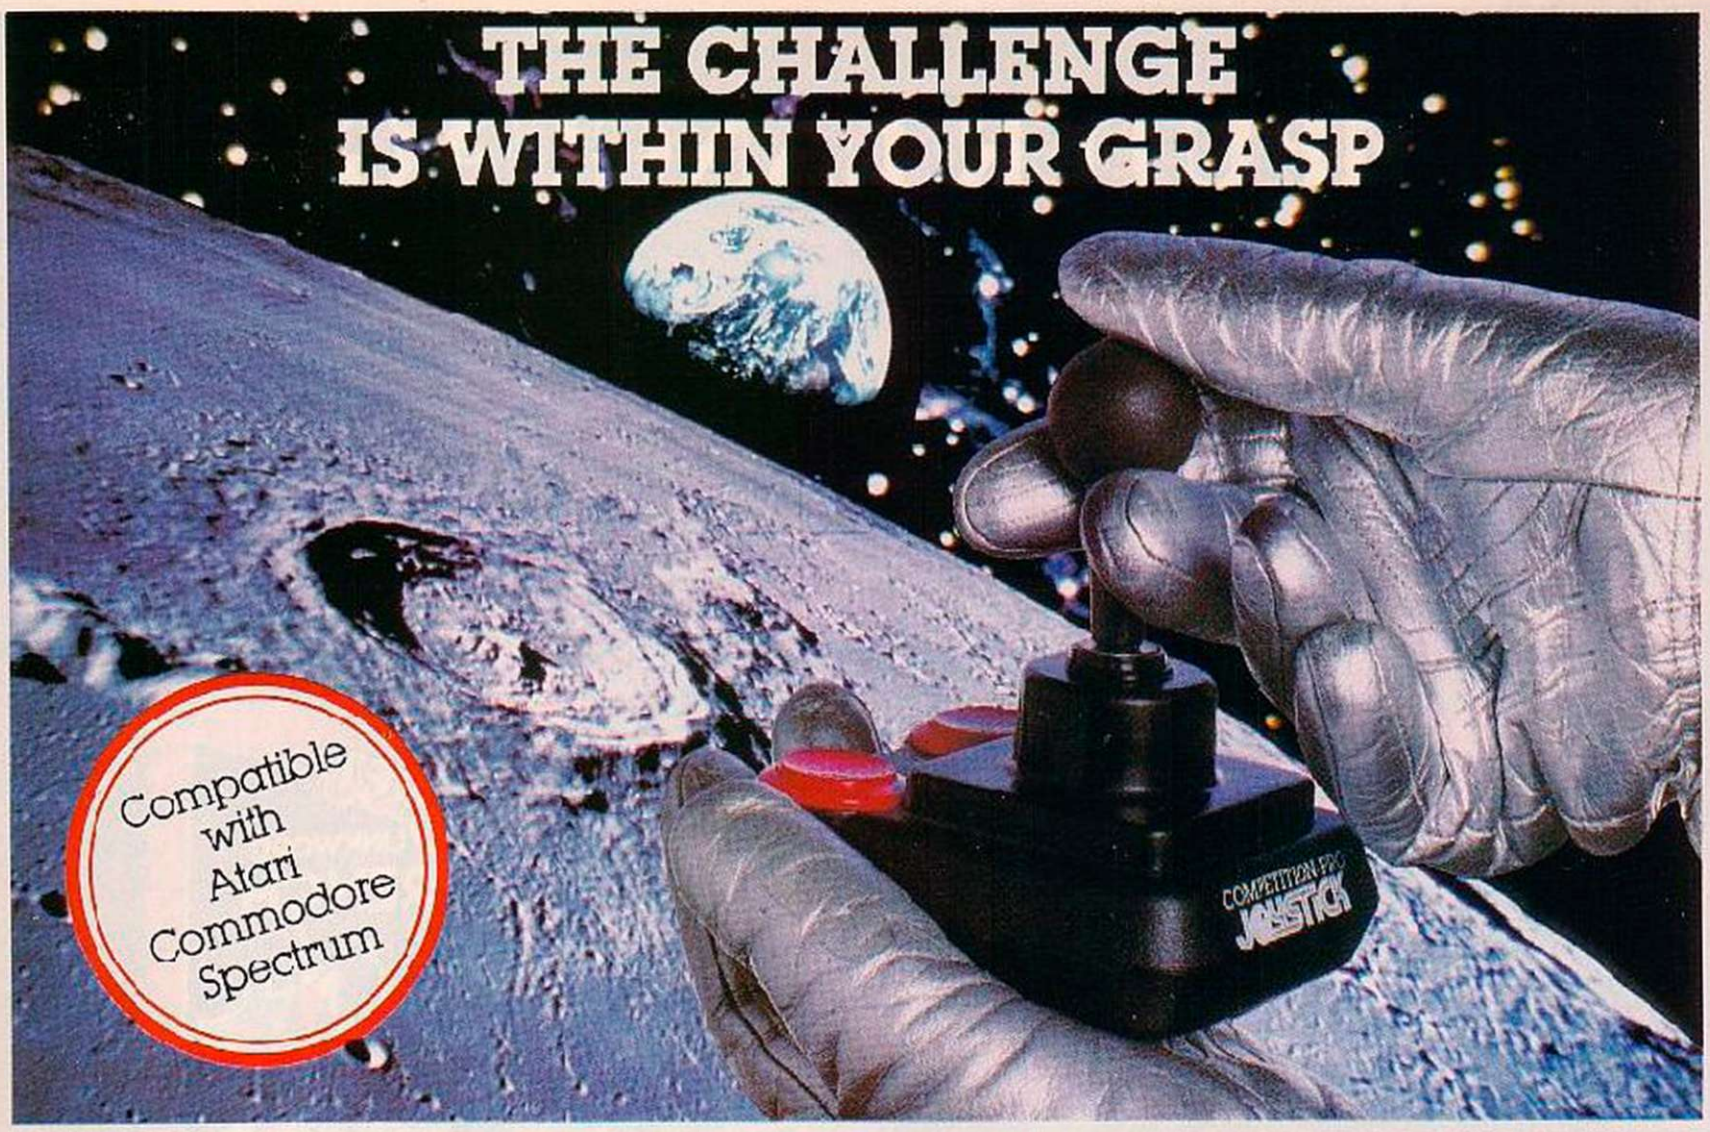
SILVER SOFT

THE CHALLENGE IS WITHIN YOUR GRASP



With the vast range of games now available for home computers each holds a different challenge. Now there are three Competition-Pro Joysticks in the Kempston range that will come to your aid and improve your playing capabilities. Your movements will become quicker, with finger poised over the fire button at the ready, your scores will be out of this world. Playing will be so much easier! If you're serious about the challenge your computer presents then you shouldn't be without a Kempston Competition-Pro Joystick.

NEW

PRO 1000

Ergonomically designed handle and base * 8-way arcade quality leaf switches for precision control * 5 foot cable to allow more comfortable playing positions * Rubber return for smooth control * Rubber protector pads on base * Base fire bar for left or right hand control *

PRO 3000

NEW

All the winning features of the Pro 1000 plus top fire button for precision one handed play * trigger fire button for true arcade realism *

PRO 5000

All the winning features of the Pro 1000 but incorporating true craftsmanship plus large 1¼" control knob for comfortable play * Unique tapered shaft for maximum sensitivity * Dual independent fire buttons * Nylon covered steel shaft for maximum robustness

KEMPSTON JOYSTICK INTERFACE FOR THE ZX SPECTRUM

Allows the use of any Atari/Commodore type joystick with the popular ZX Spectrum computer. With well over 100 games on the Spectrum now compatible with the joystick this is a must for any Spectrum owner who wants the power of a joystick added to the power of the Spectrum. Simply plugs into the edge connector at the back of the Spectrum. No modifications necessary.

Some games you can buy were produced before Joysticks were available for the ZX Spectrum. With the aid of Kempston conversion tapes these games can now be played with any of the Kempston range of joysticks.

CONVERSION TAPE I
– Converts: Horace Goes Skiing, Hungry Horace, Flight Simulation (Sinclair), Arcadia, Penetrator, Spectres.

CONVERSION TAPE II
– Converts: Orbiter, Escape, Tanx, Centipede, Spectral Invaders, Cruising on Broadway, Frenzy.

CONVERSION TAPE III
– Converts: Ah Diddums, Jumping Jack, Molar Maul, Andoids, Horace And the Spiders, Space Raiders, Winged Avenger, Muncher.

ALL £4.95 each

VIC DRAW

Arnie Blomberg with a high-resolution drawing routine.

MANY VIC-20 OWNERS often look at other computers with envy, when they see the high-resolution capabilities that most of them have. You can, of course, buy the Super-Expander cartridge, but if you cannot afford it, or would like to try without it, and have 8K or more RAM expansion, then this is the answer for you.

The program gives you a high-resolution drawing screen, 176 pixels wide by 160 high, totalling 28,160 pixels, with a small instruction and input text-window beneath.

The functions in the program are:

Point for placing one single pixel at horizontal and vertical co-ordinates that you input.

Draw a line between two sets of co-ordinates.

Square draws a square on the line co-ordinates.

Triangle on the line co-ordinates.

Circle from the centre co-ordinates and the radius.

Elipse from centre, two radii and angle of inclination.

Zpiral — yes, deliberately mis-spelt Centre, size — tightness of arms — and number of revolutions.

Lines This creates an interference pattern effect, caused by a succession of lines filling the screen.

All the functions are controlled by single-key input from the main menu in the text window. Hence Zpiral with a "Z", to avoid confusion with Square.

Other functions are:

Erase by pressing the minus key and then the drawing function.

Load/Save key f1, then L or S. You can Save or Load drawings to or from tape as shown by the prompts. If you have 16K or more RAM, you can Save the contents of two whole screens in memory and, Load it back.

Clear Screen by shifted CLR/home.

Break from drawing Circles, Elipses, Zpirals or Lines by pressing B.

Mistake? Press M during most of the input sequences.

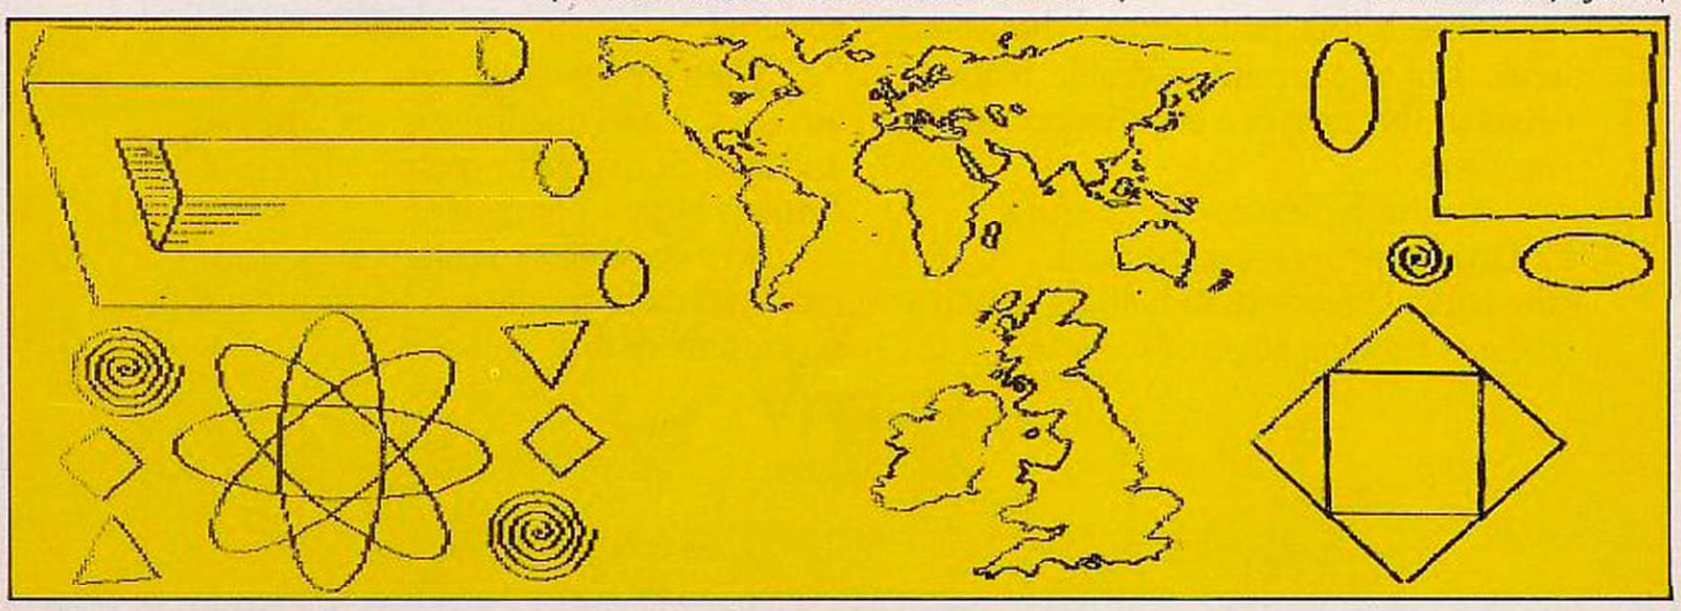
The small text is three by five pixels and is stored as complete words in the machine-code and data routine in bytes 8192-9727.

The Instructions and Input prompts are shown on two lines in the text window, leaving an area four pixels high at the bottom of the window. This area records the details of your last command, but at three by four pixels some letters and numerals are slightly unclear — just good enough to remind you what you have just done.

The program is a hybrid of machine code and Basic; machine code for speed in setting up the bit-mapped screen, and calculating positions of the pixels from horizontal and vertical co-ordinates.

The Draw function is entirely in machine code — hence the speed — also most of the text display as well as the transfer of the screen content to and from RAM memory. Basic would be far too slow. The spherical shapes, however, are calculated in Basic, by standard mathematical formulae, using machine-code Draw between frequent points on the circumference.

(continued on page 111)



HOW TO TURN YOUR SOFTWARE INTO HARD CASH.

Turning a great idea into a profitable idea isn't easy.

It needs skill, patience and sheer hard work. But to be really profitable, it also needs the backing of a large, respected company.

At British Telecom we are now looking for writers of games and educational programs to help us launch a new and exciting range of software.

If we like your idea we'll send you a cheque straightaway as an advance on royalties.

Then we'll package your program, advertise it and distribute it with the care and attention you'd expect from one of Britain's biggest companies.

So if you'd like to turn your software into hard cash, simply send your program, on cassette or disk, to

FIREFLY
SOFTWARE

British Telecom,
Wellington House, Upper St. Martin's Lane, London WC2H 9DL.

(continued from page 109)

If you are interested in dis-assembling the machine code, here is a brief summary of the routines:

8192-8238 — clears text window.
8240-8394 — prints various parts of text in text w ndow.
8400-8529 — Sets up bit-mapped screen.
8530-8605 — Plots pixel positions on screen.
8506-8659 — More text printing.
8560-8932 — Calculating Draw function.
9368-9351 — Transfer screen to RAM and vice versa.

The gaps in between and up to 9727 are filled by character store for words and numerals, and more text printing. The variables P9 and P5, which are used in all drawing inputs, are pointers to character store and their positions in the text window.

The numeric-input routine is in Basic lines 1500 to 1640. It has a built-in protection so that you cannot input more than three digits, or a number larger than the screen dimensions. Press Return after each number input.

Here is how to enter the listings: start with listing 1, the machine-code data loader. Note the Rems in lines 100 and 240 must be kept until the program has been typed in full. They allow you to run the program and test that the data is correct.

The checksum on each line verifies the accuracy of the data on that line, but not any missing or out-of-sequence lines — so check this carefully yourself to avoid frustrating crashes or other faults in the program. Ignore the fact that the screen tells you that the data is stored in memory at this stage — the Rems have prevented this.

When you have finished typing and checking it, remove the two Rems and save the loader program on tape. This should be saved as the first item on another tape. It will cause the start of the main high-resolution program to be loaded from byte 9728, instead of 4608, as the bit-mapped screen and machine codes use 5.5 of RAM. The Basic Move incorporates an automatic Load/Run for the next program.

Finally we come to listing 3 — the main hi-res draw program. Type it very carefully, especially all Poke and Sys entries. You cannot run it at all at this stage. When finished, save it immediately after the Basic Move.

Now load and run the programs in the following sequence:

1. Basic Move program, but press the Run/Stop key as soon as the word Load appears on the screen, as we do not want the main hi-res program yet.
2. The machine-code data loader.
3. The main hi-res draw program. This has a built-in routine at line 50000, which will save the machine-code data in a shorter format. To do so merely type RUN50000 and save it on tape after the main program. Then all the parts of the program will load and run in one sequence.

Now, with any luck, you should have a clear screen, with the main menu in the text window. If there are any mistakes in the main program, garbage will appear in the text window. To see what the error is type

GOTO5

and press Return without clearing the screen. It will return to normal text mode, and the error message can be read in the lower half. Clear the screen now, before changing any part of the program.

If the program crashes — that is, everything stops working — or if it stops with Ready on a clear screen, re-check the Poke and Sys

(continued from previous page)

numbers, or the machine-code data lines.

Unfortunately the Vic-20 pixel is much wider than it is high, so that if we want symmetrical squares and triangles, and circles, which are not elongated the horizontal co-ordinates have to be adjusted. This is done in line 40

DEFFNR(B) = B*.58

That is, the horizontal numbers are reduced by multiplying their value by .58. You can change the value here yourself to suit your own television screen. Try =B*1 to see what a normal Vic circle and square would look like.

Although the hi-res screen is 176 true pixels wide, the adjustment factor also means that you have to input a higher number to reach the right-hand edge — in fact 175/.58 (=301) for this particular adjustment factor. You can check what the maximum is by finding the highest number you can input as a horizontal co-ordinate.

There is a check to prevent drawing outside of the screen area, and this can result in triangles and squares having one or more sides missing, if any part of them lies beyond the edge. Spherical shapes also lose parts that lie outside of the screen. The machine-code routine lets you Draw, Square and Triangle in all directions.

A limited possibility of changing the colour of the drawn pixel can be found by changing line 70 —

Poke8456,(any number from 0 to 7)

In the same line is also the screen/border colour:

POKE 36879,25

Try

POKE 36879,225

for the reverse negative effect.

Change the variables in line 1220 — the lines routine for different patterns. Sometimes you get illegal quantity error here — type Goto5 — but no harm is done.

With no more than 8K expansion you can leave out lines 1000-1090 which operate picture storage in RAM. If you hope to upgrade later, type them in as the program checks if you have enough memory for storage.

With 24K you can store four pictures by making this change:

1042 IFQ<10ORQ>4 etc

The prompt will still read 1-2 = unless you want to redesign it to 1-4 in character store 9568-9572.

If you have a 1520 printer and would like a hard copy of your drawings, add the lines in listing 4 to the main program, and key f8 from the prime menu to activate the printer.

Finally, if you prefer not to type the program yourself, send a cheque or PO for £2.50 to me for a copy on tape, with some drawings including outline maps of the British Isles, and the World. Specify if you want the 1520 addition. 134 Aldebury Road, Maidenhead, Berkshire SL6 7HE. ■

MOSAIC MOSAIC

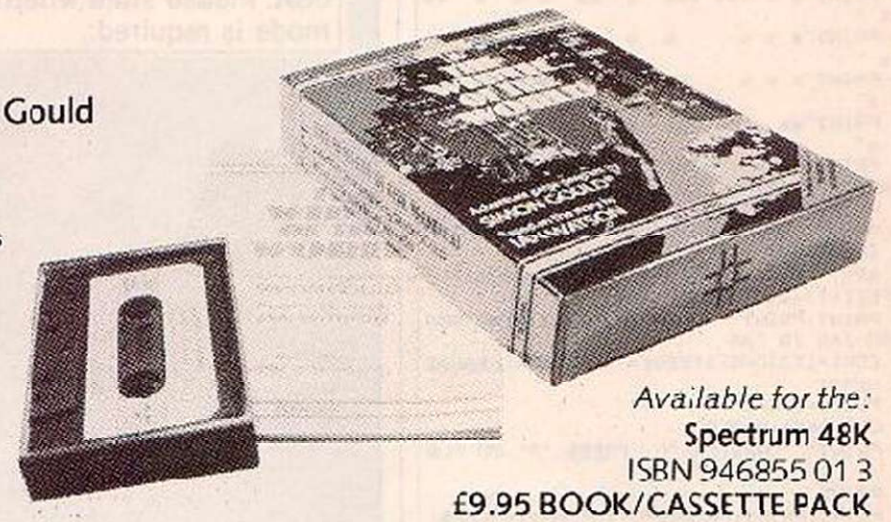
Are you ready to step beyond the arcade?

THE WIDTH OF THE WORLD

Illustrated adventure game program by Simon Gould with the SF story by Ian Watson

The world was expanding . . . people were disappearing . . . Ian Watson's dramatic story leaves a riddle that only you can solve.

You are Alan Roxbury, husband of the 'late' Sarah Roxbury who vanished ten years ago. All that time you have been waiting for the world to widen again. That time has now come. You must discover an exit point, find Sarah and bring her home . . . .



Available for the:
Spectrum 48K
ISBN 946855 01 3
£9.95 BOOK/CASSETTE PACK

IN THE BEGINNING

Program by Humphrey Walwyn

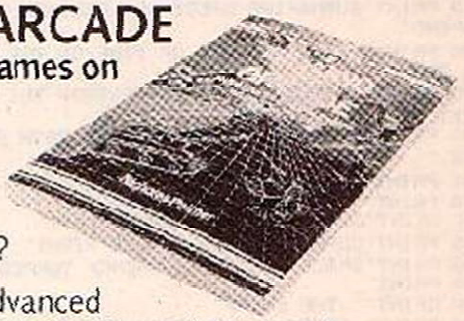
Starting life as a humble molecule in the Pre-Cambrian age, you progress through this exciting ten-level game to the Dawn of Early Man – if you are clever enough. Create the ideal fish, play a new kind of 'Snap', judge climates for your gradually evolving creature. An original combination of puzzles, arcade action and computerized board games.

Available for the: **Commodore 64**
ISBN 946855 00 5 **£6.95 CASSETTE**

BEYOND THE ARCADE

Adventures and Wargames on your Computer

Nicholas Palmer



Tired of zapping aliens?
Bored by avoiding blobs?

You're ready for more advanced computer games, ready to step *Beyond the Arcade*. This is a critical guide to the growing world of adventure games, wargames, games of strategy, games to play at home and games to play by mail.

Covers games available for all the most popular home computers.

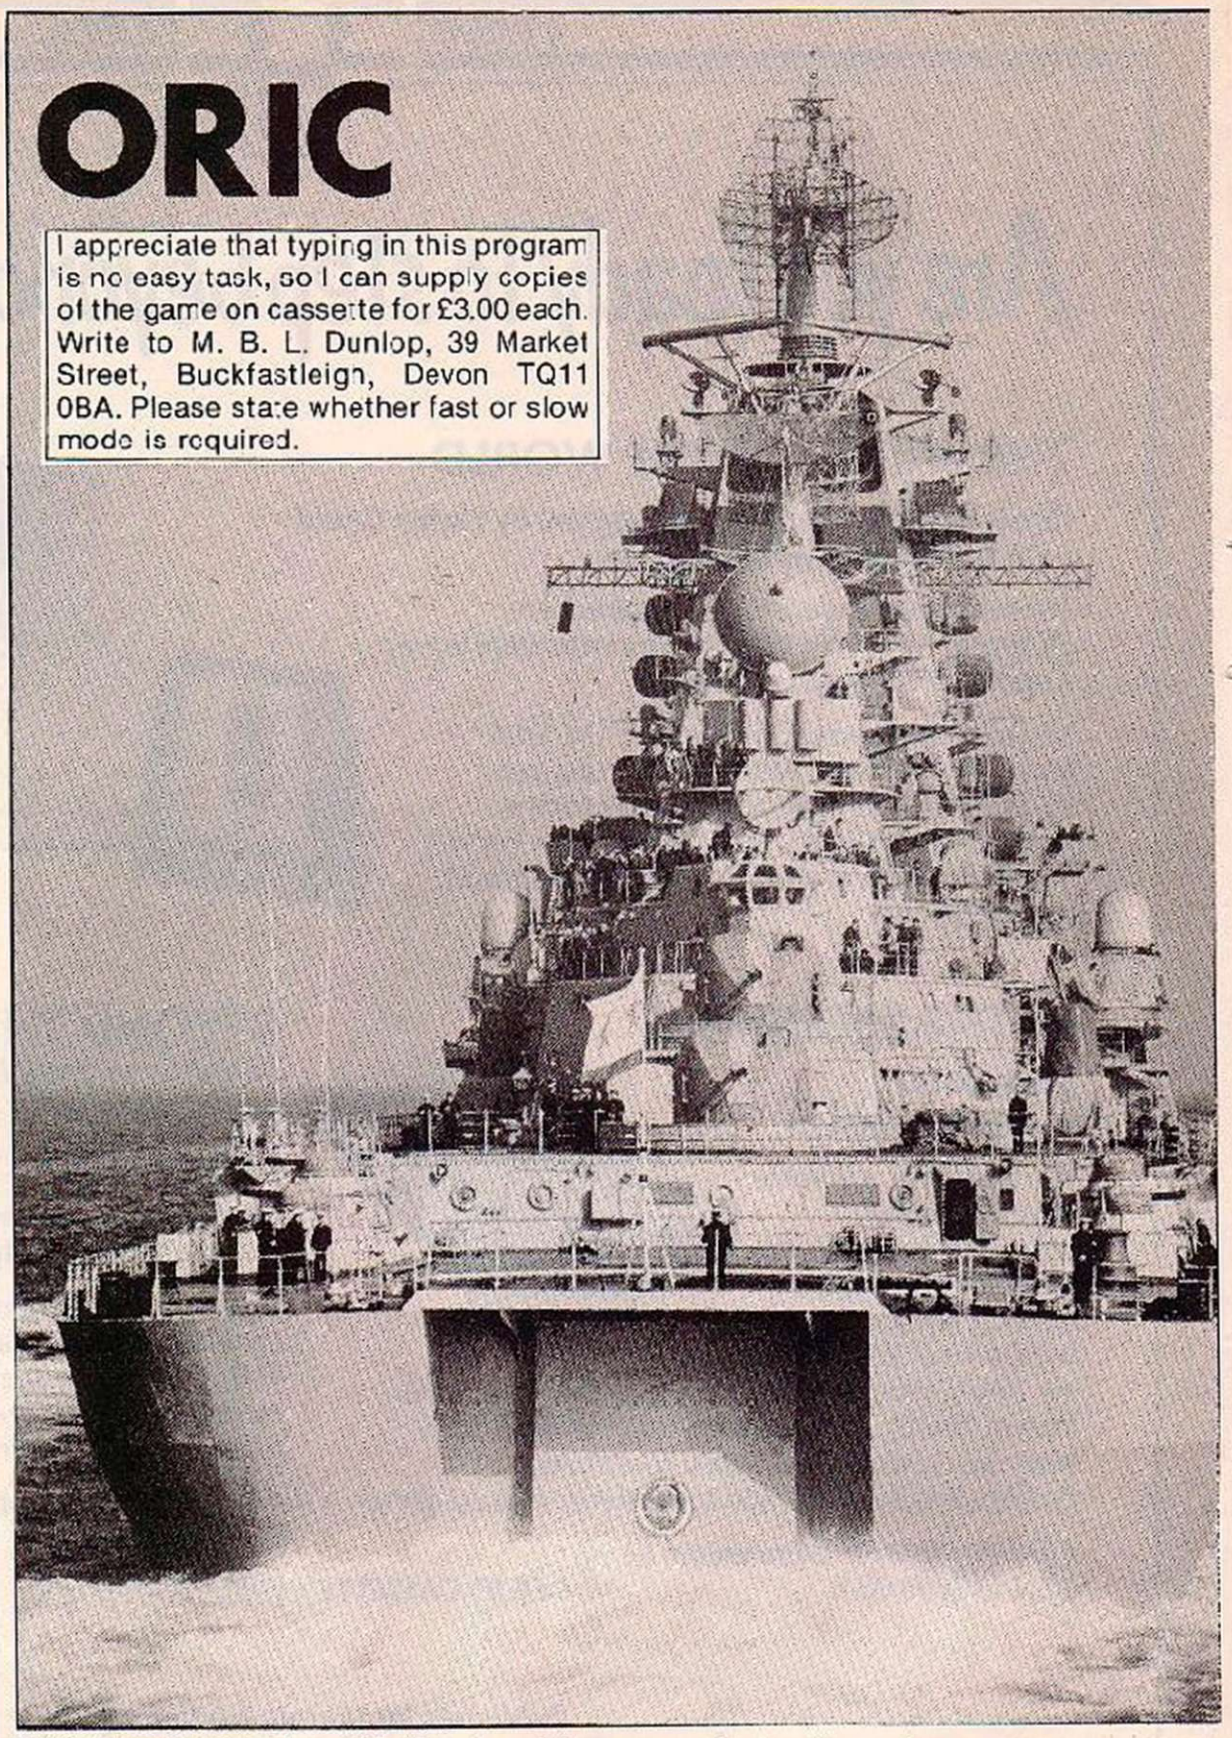
MICROPOWER

ORIC

I appreciate that typing in this program is no easy task, so I can supply copies of the game on cassette for £3.00 each. Write to M. B. L. Dunlop, 39 Market Street, Buckfastleigh, Devon TQ11 0BA. Please state whether fast or slow mode is required.



THIS GAME RUNS on a 48K Oric-1 and involves attempting to torpedo as many ships as possible before a depth charge finally homes in on the last of a supply of five submarines. There are four different types of enemy each scoring a certain amount of points when hit. Each type also moves at its own speed. Once 15 ships have been destroyed, then providing the player has not been killed in the process, a new attack wave will start together with an increase in difficulty.

The submarine sits on the second to bottom line of the screen and is moved left using cursor left, right using cursor down and a torpedo can be fired using the space-bar.

To enter the program, first type in the Basic program in listing 1. This plays no part in the actual running of the game but merely defines the graphics characters — 36 all together — loads the machine-code, resets the high score, and continually switches between the title screen and the instructions calling the machine code after the start key has been pressed.

After this has been entered, save with:

CSAVE"DESTROYER",AUTO

Next the machine-code must be entered so type New and enter the machine-code loader, listing 2.

The machine-code is listing 3 can now be typed in a byte at a time. Note the hex numbers do not need to be prefixed by a hash character. To break out of the current mode of operation on the loader, simply enter S.

As there is approximately 2½K of machine-code to type in it will require a lot of time and patience, so should you want to save the code so far entered, use

CSAVE"MC",A#A000,E#AA53,AUTO

The game is now complete and will run automatically on

CLOAD"DESTROYER"

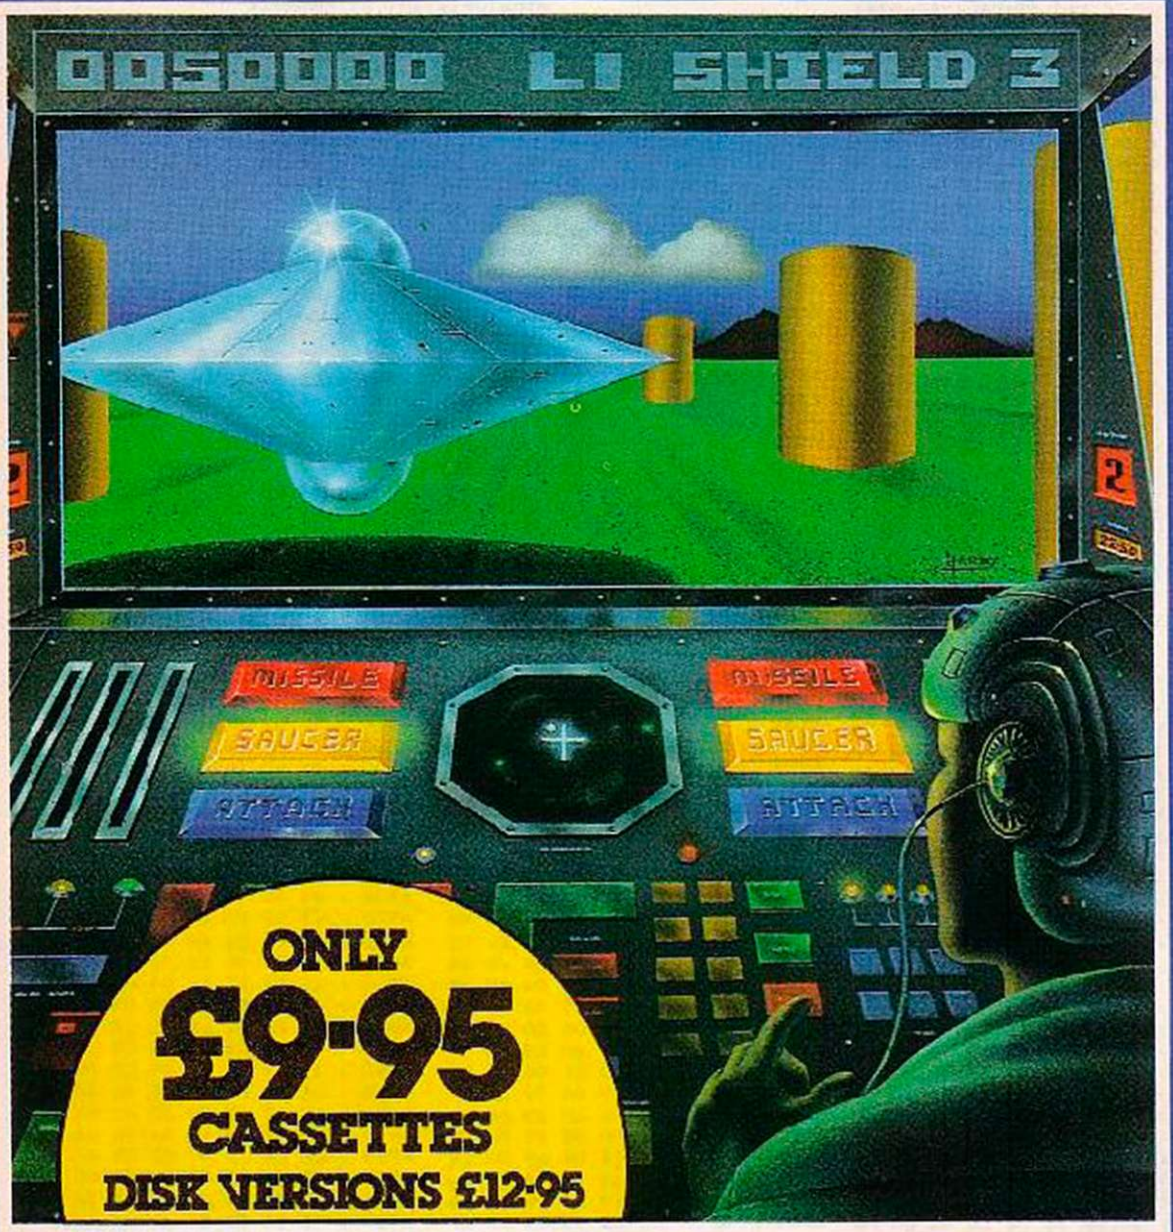
N FABULOUS 3D GRAPHICS

You're alone on a distant planet, designed to train the greatest warriors in the universe. For the first time in millions of years, YOU have activated the combat grid. Can you survive?

ENCOUNTER!

It begins here!



ONLY
£9-95
CASSETTES
DISK VERSIONS £12-95

INSTRUCTIONS FOR SURVIVAL

In a galaxy, far, far away, your starship is in orbit around a strange new world. You set off in a Seeker-Probe to take a closer look at the planet's surface. Mysterious obelisks litter the planet, clouds hover menacingly across the desolate plain, when suddenly your monitoring systems tell you you're under attack. The Encounter has begun!

An alien saucer flashes onto your view screen. Your ATTACK indicator flashes and a bolt of raw energy smashes into your protective screen. Your screen can only absorb four hits of this intensity. You must fight back!

"The graphics are outstanding...it's 3D impression is superb. The Game itself is first class." **WHICH MICRO?** Brilliant!

"Encounter is a game that will have Arcade game lovers riveted to their screens for hours on end..." **PERSONAL SOFTWARE (USA).**

"The graphics and sound in this 3 dimensional simulation are stunning" **ANALOG.**

- **Superb 3D Scrolling Game**
- **For Commodore 64 and all ATARI Computers**

BBC SPRITES

Bobby Rao explains the game using his sprites routine which was promised last month.

LAST MONTH I showed you how to define characters for the sprites routine and this month I will show you how to use them in your own Basic programs. But first a few explanatory notes on topics mentioned last month.

To achieve animation a sequence of slightly different characters needs to be displayed. To define these sorts of characters I would advise first defining a Basic character and Saving it uncompiled and then reloading it — more than once if necessary — so that each stage of the animation may be defined simultaneously, swapping between characters to simulate the animation. Then when all the characters are ready they may be Saved one after the other.

The string of addresses which you enter at the end of a sprite's attributes go to make up the sprite's normal and termination sequences of animation. The characters at the given addresses are displayed in order, repeatedly. To obtain an effect like a pendulum swinging then, although only three distinct characters are required — the pendulum to the right, to the left and at the centre — the characters must be displayed in the order centre, right, centre, left. Thus four frames of animation are required here and the character addresses must be entered in this order. This method applies to many types of animation so please note it carefully or you will end up with jerky animation.

Sprite magnification

When using the magnification facility note that as the sprite grows or shrinks its centre remains stationary or moves with the speed defined for the character.

Hit colours — I explained the easiest way to use these last month but if you understand how colours of pixels are stored in bytes by Mode 2 then let me say that each byte altered by printing a character is "Anded" with the hit colour byte for that sprite and if the result is not zero a hit is registered.

Printing — When you have the sprites routine in memory then by loading the code produced by CHARPRT. To print a sprite character in memory onto the screen xLOAD the sprites routine and "PRT CODE". This latter Loads into $C00 to $C1F so the first fouruser definable characters are unusable. To print a character at $1300 in memory at $20 along the X axis and $80 down the Y axis use the following in Mode 2:

```
&74 = &13008020
CALL &LC00
```

The character should now appear and to remove it use the same commands. Note that you can print onto the screen at any time while sprites are in motion and they will move without corrupting the background.

After you have defined and Saved the code of the sprites using the sprites' generation program you may use this code by first setting PAGE to &2000, typing New and then *LOADing the code. To start the sprites first go into Mode 2 and then use the following lines of Basic:

```
?&8D = 0 : ?&8F = 0 : ?&D3E = no. of sprites : ?&D3F = 0 : ?&8E = 1
?&FE6E = &1F : ?&FE6D = &E0 :
?&FE6E = &E0
?&FE6B = (?&FE6B) AND &BF
?&FE68 = 0 : ?&FE69 = 30
?&206 = &4F : ?&207 = &12
```

To stop the sprites use

```
?&FE6E = (?&FE6E) AND 127
```

To make the sprites move more slowly put a larger value in &8E — 1 is fast and 256 is slow. Location &D3F contains the number of dead sprites and is updated each time a sprite dies, that is, finishes its termination sequence and disappears.

To see at any time if a sprite number N is dead use

```
?(&D40 + (4xN))
```

which will return a value greater than 128 if the sprite is dead.

Page &D is used by the routine and for every sprite there are four bytes which hold data about where the sprite's attributes are.

The first byte of the four holds the length of the sprite's attributes. Also 128 is added to this number if the sprite is dead.

The second and third bytes hold the address of the sprite's attributes — low byte followed by high byte.

The fourth byte of the four contains the number of the frame currently being displayed — initially this contains.

(continued from previous page)

The first of these groups of four bytes is at &D40 because the memory from &D00 to &D3D is used to hold a copy of the attributes of the sprite the routine is working on. This is the limiting factor in how many frames of animation one sprite can have, that is, its attributes must fit into &D00 to &D3D.

To alter any of the sprites' attributes you must first find out where in memory they are stored. The "next free address" stated after loading in character data for the sprite defining is where sprites' attributes start. The length of this data for a particular sprite is given by 20 plus twice the number of frames of animation used in normal movement and in the termination sequence. So for a sprite with four normal frames and three termination frames the total length of its data is $20+2\times(4+3)=34$.

Although this is all you really need to know to be able to write a game using the sprites you probably still have no idea how to go about it so I will outline a Galaxians-type — with listing — as an example.

The first thing to do sounds obvious: define the game.

My game will consist of several levels of various types of aliens each type moving in a different manner and each member of a level moving independently of each other. The player will be represented by a ship at the bottom of the screen which may fire single bullets upwards, move left or right and thrust upwards, being pulled down again by an unknown force.

With the sprites routine in position and Page set to &2000 there is 4K for a Basic program and 3¼K for sprites characters and attributes. I thought that at least four frames of animation would be required for good effects so with a three frame explosion the attributes for a sprite would be 34 bytes long. Also I thought that seven aliens would be adequate for each sheet and this together with the player's ship, its bomb and three bombs for the aliens means that at any one time 12 sprites may be active.

Thus, as the attributes for a bomb are 24 bytes long the attributes can take up $(7\times34)+(1\times34)+(3\times24)+(1\times24)=368$ bytes. However if on one of the levels the aliens have more than three frames of animation this number will increase by 14 per extra frame, so be on the safe side we may assume that 400 bytes are needed for sprites' attributes. I want eight levels of aliens and if each has three characters of 10 by 15 pixels for its normal frames of animation these characters would occupy $8\times3\times(10\times15/2+2)=1968$ bytes. This figure arises because when you define a character of 10 by 15 pixels and Save it compiled, it only takes up half the number of bytes you would expect because of the way Mode 2 stores pixel colours. Also for each character you must add two bytes for height and width.

To this figure we must also add the space taken up by the ship, which is of three 10 by 15 frames, and the explosion which is used for both aliens and the ship; this is also three 10 by 15 frames. Thus the total space occupied by characters is 2430 bytes. Hence this plus the room taken up by sprites' attributes gives about 2800 bytes used leaving about 500 bytes free for more frames in certain levels or some larger characters.

Now we have defined our game we can concentrate on the fun part: defining the characters. You can do what you like here and if you feel particularly artistic try to make the levels have more than four frames of animation. However, there are a few things to note: try to fit the characters for each level into about 300 bytes per level and do not forget to leave room for your ship and an explosion — three frames.

The explosion will be the same for all the aliens on all levels and also for your ship so try to make all these characters about the same size because it looks odd when a tall, thin alien has a square explosion half its height. When defining a bomb a simple 6 by 2 block is sufficient and if you are lazy you can use the same character for both the aliens' and your ship's bombs. The bombs will have no explosion and will disappear on hitting something.

Also define your bomb using only flashing colours because we will later define aliens so that they only crash into flashing colours — just passing through the other colours. Do not use flashing colours for any other characters. After you have defined and Saved — compiled — the characters you need set Page to &2000, type New and Load in the Basic part of the sprites defining program listed last month. Run this program and Load in all your character data.

I advise you to make a list of the characters you Load in and their corresponding addresses in memory as told to you by the program. I include part of the list I made so you can see how it is used in the game listing given later.

FILENAME	*ADDRESSES OF SUCCESSIVE FRAMES (IN DECIMAL)*
Rocket	4864,4941,5018
Skull	5095,5172,5249
Wobbler	5326,5403,5480
— 6 more alien types	
Explosion	6788,6865,6942
Ship	7019,7096,7173
Alien missile	7250
Ship's bomb	7258
Next free address is	7266

When you have finished you will be told the next free address after the character data in decimal. Convert this number to hex (as detailed on pages 410 and 411 of the User Guide) — let us call it WXYZ — and use it in the following command:

xSAVE"chardata" 1300 WXYZ

This will Save the character data all in one go for use with the actual game program. We do not need to use the rest of the sprites defining program because many of its

(continued on page 120)

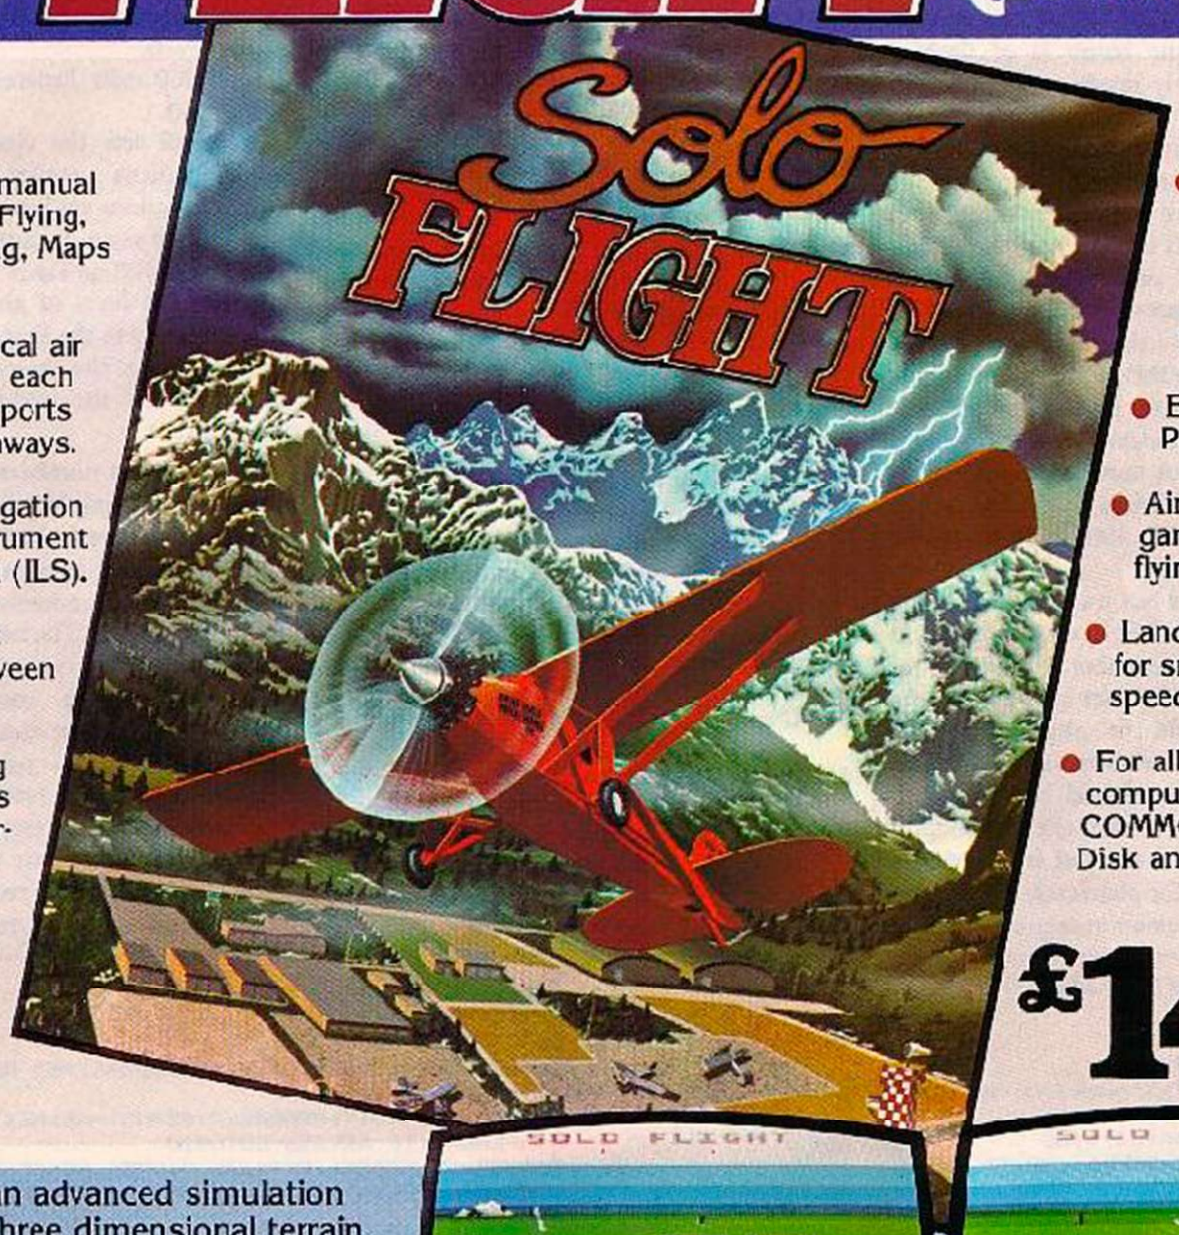
At last... A REAL FLIGHT SIMULATOR!

Solo FLIGHT

ATARI

commodore 64

- Extensive flight manual including Basic Flying, Instrument Flying, Maps and Charts.
- Three geographical air navigation areas each with multiple airports and multiple runways.
- Dual Radio Navigation (VOR) and Instrument Landing System (ILS).
- On screen flight path review between flights.
- Multiple Landing Approach Charts and Design-your-own approach feature.
- Take-offs and Landings under all weather conditions.



- Cross-Country Navigation via Landmarks, VOR Stations and Dead Reckoning.
- Emergency Procedure Practice.
- Air Mail delivery game to test your flying skills.
- Landing ratings for smoothness and speed.
- For all ATARI computers. COMMODORE 64 Disk and Cassette.

£14.95

SOLO FLIGHT is an advanced simulation that uses realistic three dimensional terrain graphics, actual configuration instrument panel, multiple air navigation maps, and accurate aircraft performance characteristics to provide the challenge, thrill, excitement, and joy of the flight experience.

SOLO FLIGHT is a quality product from MicroProse Software

functions will be duplicated and used repeatedly in the game program so do not enter Data lines as the program asks.

Now type in and Save one after the other listings 1 and 2. These Load the character data, the sprites routine and the game program. Make a copy of the character data and the sprites routine — listed last month — after listings 1 and 2.

You must type it in as it is printed and will have to adjust it to fit your graphics which are, of course, different from mine.

Here are a few points to note about the data lines — 60 to 100.

All the sprites are normal size. Note that the aliens can crash into flashing colours only, so as long as only your bomb is of flashing colours they will only crash on hitting that. Your ship stops on hitting any edge of the screen. Also your ship will explode on hitting any colour — so the program cannot let you go faster than your bomb or you may hit it. Your ship always starts off at 40 along the X axis and 237 down the Y axis. Your bomb has an upward speed of six pixels per frame and does not move sideways — these are not changed by the program. Also this sprite will terminate on hitting an edge or on hitting any colour.

The aliens' missiles move down at six pixels per frame and do not move sideways. They also terminate on hitting any edge or on hitting any colour. Line 100 is just to tell the program data ends here.

Type in these lines but make the following changes: the fifth number in each line should be changed to the number of frames of animation you have for that sprite type, the sixth number should be changed to the number of frames of termination animation, the eighteenth number should be changed to 128 plus how long you want the termination sequence to go on and the last few numbers which are addresses for characters making up the sprite and its termination sequence should be changed to suit your graphics. For the aliens' line insert addresses for the first type of alien — these will be altered by the program to suit each level. Lines 110 to 200 are used to set up system variables which are listed below.

ST%	This the start of the sprites' attributes
FLT%	The number of fleets (levels) of aliens
ALN%	How many aliens there are per fleet
ALNB%	The max. number of alien bombs on the screen simultaneously
FRM%	The no. of frames of animation of the aliens (must be same as n line 60 data statement)
TFRM%	The number of frames of animation of the aliens (must be same as in line 60 data statement)
TDUR%	Length of aliens' termination sequence
SFRM%	Number of frames of animation for your ship (must be same as n line 70)
STFRM%	Number of frames of termination sequence for ship (must be same as in line 70)
ATL%	This is the length of the attributes for each alien sprite.
SATL%	The length of attributes for the ship. This is also calculated as above
MATL%	The length of attributes for the ship's bomb and for the aliens' missiles. This is not calculated and assumes a sprite with only one frame of animation that disappears on hitting something
SHP%*	The address of the ship's attributes.
SHPD%	The address of the ship's data in PAGE &D
BMB%	The address of the ship's bomb's attributes
BMBD%	The address of the ship's bomb's data in PAGE &D
MIS%	The address of the first sprite that is an alien bomb
MDS%	The address of the first sprite that is an alien bomb's data in PAGE &D

All the last five variables are calculated and change with other relevant variables. Lines 210 to 230 call PROCINIT repeatedly so I will now explain this procedure. Lines 850 to 920 are PROCINIT. This is a procedure which will you must have in any program you write with sprites as it stores the sprites attributes and data in &D page in the correct place.

Line 250 sets some more variables:
G% is the number of goes you have (lives)
E% is the number of bombs you start with
L% is the level you are on
H% is how many times you have completed all the levels.

Line 260 calls Procreset which is at lines 510 to 610.

Proclevel sets the characters which make up the aliens' sprites, sets their speeds and their actions on hitting a screen edge for each level of alien. It obtains this information from lines 1100 onwards. These Data lines — one for each level of aliens with line 1100 corresponding to the first level — contain first the addresses of the characters which make up that alien in the order you want them displayed.

The next two numbers control the sprites' speed in the X and Y axes respectively. If the speeds are entered then each alien has that speed but if 128 is added to the speed then each alien has a randomly chosen speed up to the speed entered. The next number is bounce control — see last month's article. The last two numbers are random displacement controls and say how much random speed the sprites should have — see last month's article. All the parameters reset by Procreset and Proclevel should be reset each time you wish to reincarnate or initiate a sprite.

Line 260 then calls Procstart — lines 930 to 1000 — and this initiates the interrupts

The SV·328 just goes on growing...

With sophisticated 3-channel ADSR sound, high resolution sprite graphics and a rapidly expanding library of software, the Spectravideo SV 328 is all you'd expect in a great games machine.

A slick word processor-style keyboard, CP/M* compatibility and massive RAM (expandable to full 144K) puts it in the business league.

And for keen programmers, the easy-to-use and space saving extended BASIC gives total control of all standard functions.

There's room to grow too – with a complete range of peripherals already available, including some of the best joysticks in the business.

At £262 the SV328 is great value for money!

Spectravideo SV 328: Memory – 32K ROM expandable to 96K. 80K on board RAM expandable to 144K: **Keyboard** – full word processor type, 87 keys, 10 function keys, built in cursor control: **Graphics** – 16 colours, 256 × 192 high resolution graphics, 32 sprites: **Sound** – 3 channels, 8 octaves per channel. **CP/M* compatibility** – to over 3000 existing software packages: **Storage** – cassette drive, 256K disk drive capacity. **Suggested retail price** – £262.

Spectravideo SV 318: Suggested retail price – £186.

Spectravideo Peripherals: Cassette Drive: Disk Drive – single: Disk Drive – double: Disk Drive – full Business Pack: MiniExpander: Super Expander: Monitor: Printer with Interface Card: Centronics Interface: RS 232 Interface: 16K RAM Pack: 64K RAM Pack: 80 Column Card: Coleco Adaptor: Quick Shot Joysticks.

HEAD-UP DISPLAY

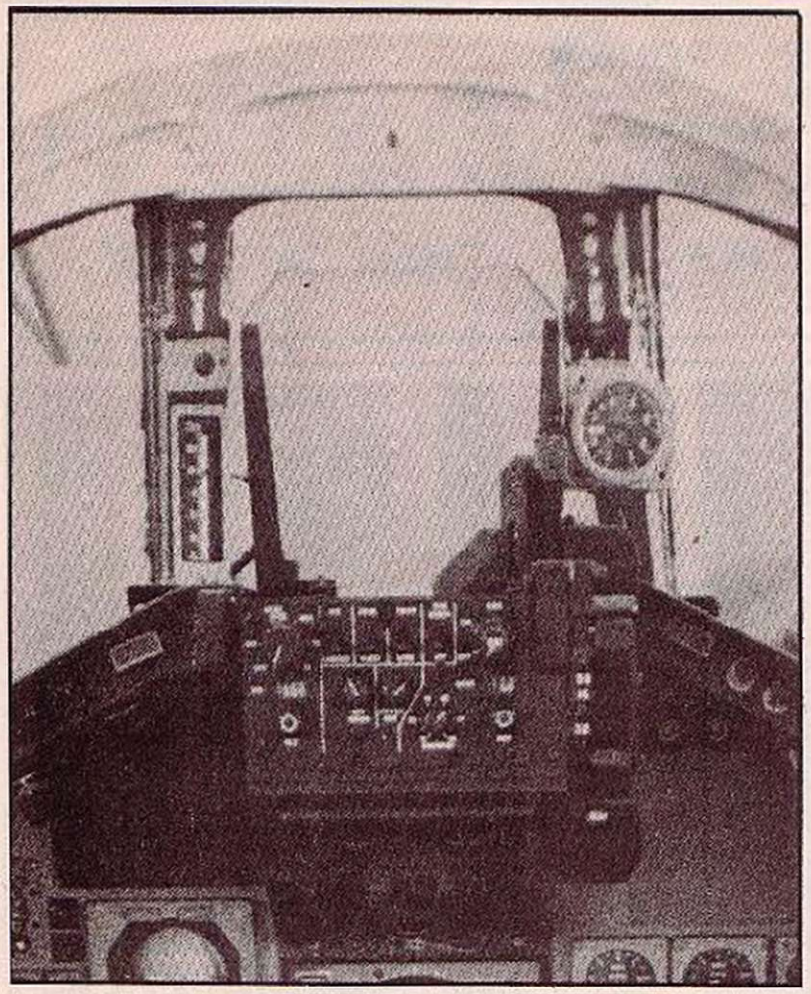

Figure 1: Layout of display

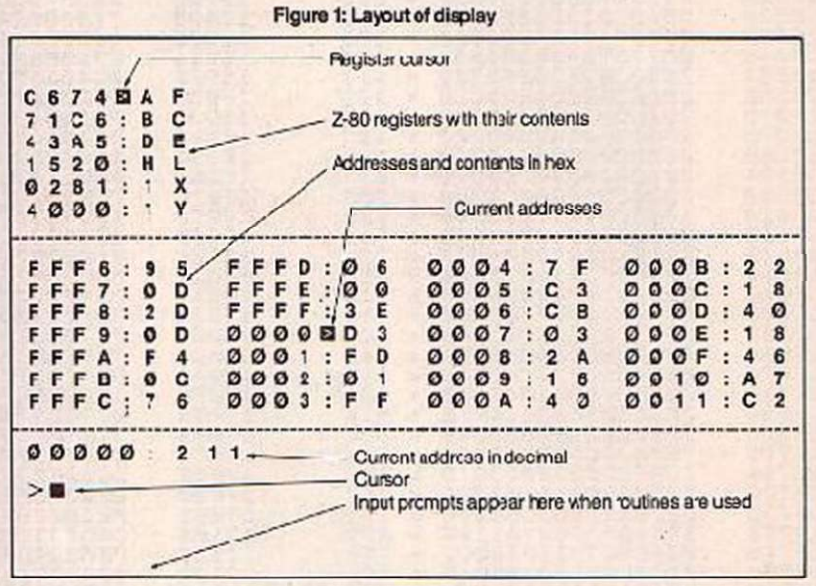

ZX PANEL is a program for the 16K ZX-81 providing a front panel display similar to those found on Research Machines and Memotech computers. It provides a means of easily entering and debugging machine code programs.

ZX Panel is initially stored in a Rem statement for the purpose of saving it, but relocates itself above RAMtop upon loading. The Rem statement is of length 1099 bytes; this can be entered in the following way; enter

1 REM @@100 CHR$ @@

Edit this line, changing the line number to 2, and adding an extra five characters after the Rem. Edit line two eight times to create lines 3 to 10 all of the same length. Then type in the following statements directly, do not attempt to list the program automatically by pressing new line, as this will crash the computer.

```
POKE 16511,77
POKE 16512,4
POKE 16514,118
POKE 16515,118
POKE 16510,0
```

Then enter program 1, the hex loader. Run this program and enter the hex codes — program 2 — in the normal fashion. When the last code has been entered the hex loader will stop. Now delete the hex loader, and enter program 3. Type RUN, and the program will be saved on cassette. When the save is completed press E and ZX Panel will locate above RAMtop, which will be set to 28672, and execute New. . . . Now enter

RAND USR 29126

and the display should appear as in figure 1. If the computer crashes at this point, or any other during the testing, reset the computer and reload the program from tape. When the message appears on the screen after loading, press Break and enter program 4, the hex checker. Run the program and check the code displayed against those in program 2. If any discrepancies are found, correct them with a direct Poke statement.

Program 1.

```
  99 REM HEX LOADER
 100 PRINT "START ADDRESS"
 110 INPUT S
 120 PRINT "FINISH ADDRESS"
 130 INPUT F
 140 FOR N=S TO F STEP 8
 150 LET T=0
 160 PRINT N;" - ";
 170 INPUT A$
 180 PRINT A$;" = ";
 190 INPUT TOT
 200 PRINT TOT
 210 LET Z=0
 220 FOR K=1 TO LEN A$ STEP 2
 230 LET C=(CODE A$(K)-28*(A$(K)>"
9")-7*(A$(K)>"F"))*16+CODE A$(K+1)-28
 240 LET T=T+C
 250 POKE N+I,C
 260 LET Z=Z+1
 270 NEXT K
 280 IF TOT=T THEN GO TO 310
 290 PRINT "ERROR - PLEASE INPUT AGAIN"
 300 GO TO 150
 310 NEXT N
```

If all is well so far, we will now explore the program. The hex address near the centre of the screen indicated by the Sinclair program cursor is called the current address. Code can be entered at the current address by merely typing in one, or a string of up to 15 two-digit hex numbers. The panel provides eight routines, which are accessed by typing full-stop followed by the number of the routine required, followed by Newline. Various parameters are then requested for that routine. The routines are as follows:

ROUTINE 0: This is a routine to change the current address. To change the current address to an address where we can enter code enter ".0 Newline", and in response to the prompt "START?" Enter 7436, followed by Newline. All inputs are in hex, so only key presses from full-stop to F will be acknowledged, though Rubout can be used as normal, Newline will increment the current address by 1, cursor up (shifted 7) will decrement the current address by 1. Enter a short program at this address, e.g.,

3E0106FFD710FDC9 Newline

ROUTINE 1: This moves a block of code. There are three parameters to be entered, Start and First are the first and last addresses of the block to be moved, To is the address the block will be moved to. To test this routine enter ".1 Newline" and enter 7436,743D and 7437 respectively in response to the prompts. The program you entered should now have moved forward 1 byte. To move it back again enter 7437,743E and 7436 in response to Start, Finish and To. Code can also be moved larger distances, e.g. from Rem to above RAMtop.

ROUTINE 2: This runs a machine code subroutine. The registers AF, BC, DE, HL, IX and IY take the values indicated in the top left corner of the display before starting the subroutine — these can be altered (see Routine 7) and on returning from the subroutine, the values of the registers as they were at the end will be displayed.

When the subroutine has finished, a key must be pressed to return to the panel display. To run the program we entered, enter ".2 Newline", and 7436 in response to the prompt. The screen will clear and a series of blocks will be displayed, press any key to return to the panel display. Breakpoints may also be set using Routine 4.

ROUTINE 3: This fills a block of memory with a constant. There are three parameters, Start and Finish are the first and last addresses of the block to be filled, With defines the constant. The constant is an 8-bit — 2 digit — hex number, though it must be entered as four digits, e.g. to fill a block from 7438 to 7440 with FF, enter 7438, 7440 and 00FF in response to Start, Finish and To.

ROUTINE 4: This sets a breakpoint at the address specified. When your machine code subroutine reaches a breakpoint, it will jump back to the panel display, showing the values of the Z-80 registers at that point in your sub-

routine. When the breakpoint is reached, the memory at that point is replaced to its original contents, so if the breakpoint is required again it will have to be set again.

ROUTINE 5: This displays a block of memory from the address specified by Start, but displays the contents of the memory as characters corresponding to the value of the address. Enter the routine by ".5 Newline", and in response to Start, type 0100 newline. This displays a part of the ZX-81 ROM where the data for the keywords is stored. To advance the display press Z, to go backwards press 1. To return to the normal panel display type H. Only those characters with codes 0-63 and their inverses are displayed, others are shown as spaces.

ROUTINE 6: This quits the panel display, and returns to Basic. To re-enter the panel type

RAND USR 29126

ROUTINE 7: This allows you to change the values of the Z-80 registers AF, BC, DE, HL, IX and IY as shown in the top left corner of the display. This can be useful if you wish to give a particular register a value before jumping to a machine code subroutine with ".2". The register cursor, as shown in figure 1 indicates which register is to be changed. It is

When you have selected the register to be altered, enter ".7 Newlire", and you will be prompted for the value you wish the register to take. This value will not take effect until you run a machine code subroutine using ".2". Do not attempt to alter the values of IX and IY unless you know what you are doing, as you could crash the computer.

These are the only routines implemented at present, though there is the facility for at least eight more that you may wish to implement yourslef. A jump table is located at 72A1 hex from which the program is vectored to each of the routines. The vector of the first unused routine, that is ".8" is located at 72B3. The start address of your routine would be stored low byte at 72B3 and high byte at 72B4. The start address for ".9" would be stored at 72B5 and so on, up to ".F" which would be stored at 72C1 hex.

If you wish to input parameters for your routine there are subroutines within the program which will help you. To input a start address call 72E7, on return the value input will be in the DE register, and also stored at 702F/7030 hex.

To input a finish address call 72F5, on return the value input will be in the DE register and also stored at 7031/7032 hex. To input a parameter with a different prompt message, store your message in the memory at a convenient point, load the DE register with the start address of the message, load the BC register with the length of the message, then call 72C3.

This subroutine will display the prompt, input the value, and return with the value input in the DE register. Only four-digit hex numbers can be input in this way. End your routine with a jump either to 71C6 if the screen has been cleared, or to 71CC otherwise. Some routines that come to mind are search and replace routines, a disassembler, or some Easic utilities.

A general breakdown of the program is (all addresses in hex):

700C-702B:	Data for messages.
702C-7044:	System variables.
7045-705E:	Print at B register (y coord), C register (x coord).
705F-706F:	Print value of B reg in hex.
707C-707D:	Print value of HL followed by colon.
707E-70B1:	Print four columns of hex addresses/contents.
70B2-70F9:	Routines for printing in decimal.
70FA-715A:	Routines to store, load and print registers.
715B-716D:	Move register cursor.
716E-7181:	Print two dotted lines across screen.
7182-719E:	Clear bottom six lines of screen.
719F-71B7:	Wait for key press, return value in A reg.
71B8-71C5:	Decode a hex number on screen, value in A reg.
71C6-728A:	Accept key presses, check and evaluate inputs.
728B-72A0:	Jump to selected routine.
72A1-72C2:	Jump table.
72C3-7302:	Input routines already discussed.
7303-7435:	Routines 0 to 7.

VISION STORE

South London's Largest Specialist Micro Computer Centres Offer

INTEREST FREE CREDIT

on Micro Computers and Peripherals

In addition to offering computers and peripherals at low, low prices, Vision Store now offer Interest Free Credit i.e. paying over 6 or 9 months with no interest charge. To take advantage of our Interest Free Credit Scheme come to one of our stores where our friendly staff will help you complete the form. Then subject to status, after paying the deposit, you can take the goods away with you. It's as simple as that!

SOFTWARE

Dont forget –
We are London's largest stockist of Micro Computer Software. Over 1,000 programmes in stock for games, educational and business. Continuous demonstrations.

EXPORT

All our hardware and software is available Tax-Free to overseas customers, please send for our comprehensive list. Please contact our Croydon office.

MAIL ORDER

We send our whole range anywhere in the UK by FREE Insured Securicor Delivery. Please contact our Croydon office.

All Prices include VAT

Interest Free Credit available to Mail Order Customers. Phone or write for details.

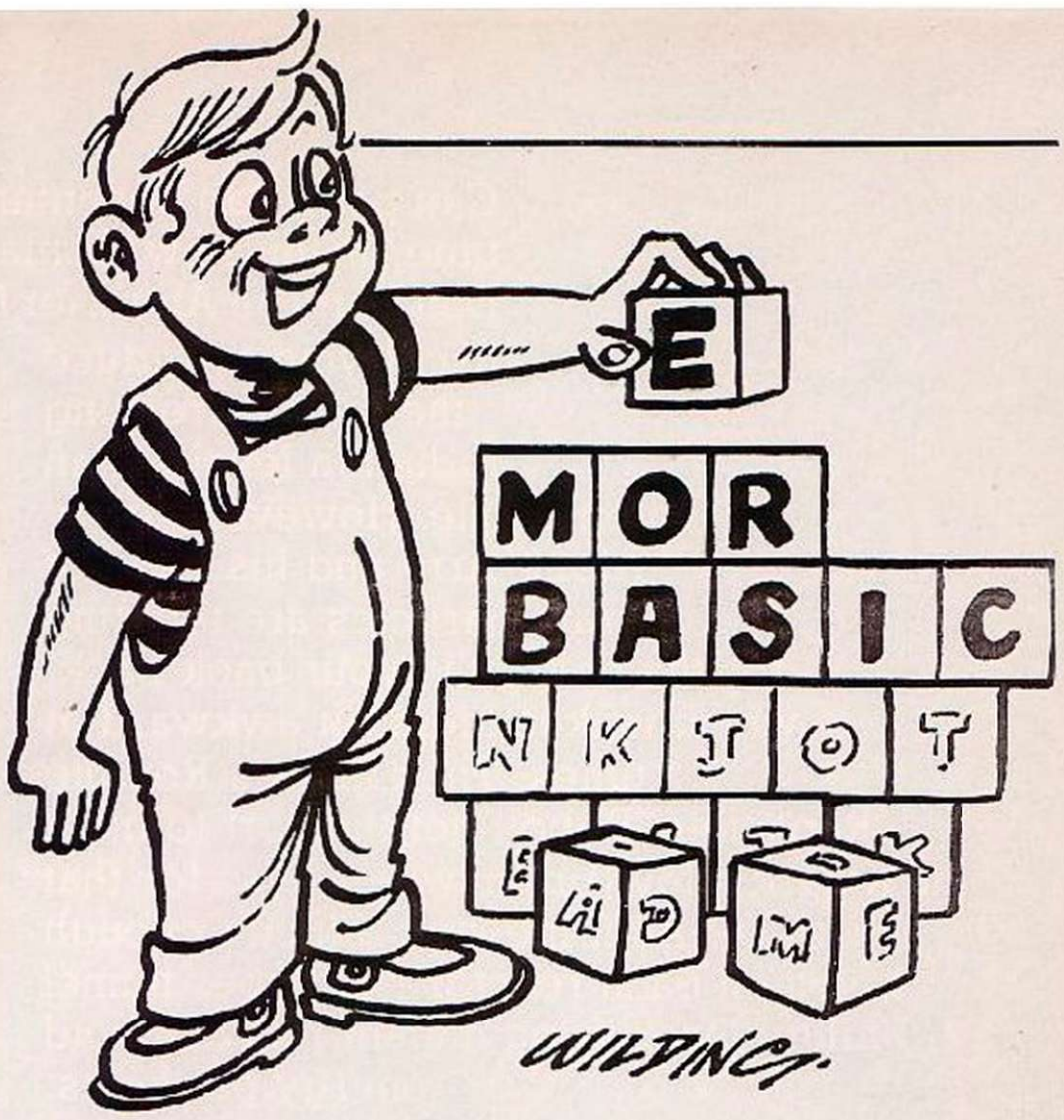
CBM-64



EXTENDED BASIC

THE COMMODORE 64 with its extensive sound and graphics facilities has many features seldom found on other computers. Unfortunately it has an outdated and totally inadequate resident Basic, and as a result the programmer has to look up complicated Peeks and Pokes to make use of the sound, sprites and other features. Not only does it take a long time to write a program in this manner, but also making a mistake in the Poke statement can cause the computer to crash irretrievably.

To remedy this problem, I have written in machine code a set of routines to do all the necessary Pokes for you. The routines are accessed using the Sys statements followed by the routine's name and its parameters.

To enter the program, first type in program 1 and save it at the beginning of a cassette. Then type in program 2, and run it. There will probably be numerous data entry errors, so there is a checksum for every line. If you get an error, correct the appropriate line and rerun the program. If all the data is correct, you will be asked to position the cassette. At this point make sure that the tape is positioned just after program 1, then press a key. The data will then be saved. It is a good idea to save program 2 elsewhere as a back-up.

To use the new commands, rewind the tape to the beginning and press Shift and Run/Stop. The computer will take care of itself from then on.

The following commands should now be available:

VOLume — sets the overall volume.
Format: SYS49664, "VOL" volume 0-15.

ENVelope — sets the attack rate, decay rate, sustain level and release rate.
Format: SYS49664, "ENV" voice 1-3, attack 0-15, decay 0-15, sustain 0-15, release 0-15.

SILEnce — clears the SID chip, turns everything off. This routine should be used before and after using sound.
Format: SYS49664, "SIL".

PULse — sets the width of the pulse wave.
Format: SYS49664, "PUL" voice 1-3, width 0-4095.

WAVe — sets a waveform for a particular voice.
Format: SYS49664, "WAV" voice 1-3, waveform 0-3 where 0 = triangle, 1 = saw-tooth, 2 = pulse, 3 = noise.

VOIce — turns on, or off, a particular voice and sets its pitch.
Format: SYS49664, "VOI" voice 1-3, pitch 0-96 where 0 = off.

SOUnd — turns on a voice at a particular pitch for a set duration, then turns it off again.
Format: SYS49664, "SOU" voice 1-3, pitch 0-96 where 0 is off and duration 0-32767 — 100 is about one second.

POInter — sets sprite pointer.
Format: SYS49664, "POI" sprite 0-7, location 0-16383. If you have changed the video bank, add the starting location of that bank on to the second parameter for the correct location. Also, the pointer is set to the last multiple of 64 if the location required is not divisible by 64.

ENAble — turns a sprite on or off.
Format: SYS49664, "ENA" sprite 0-7, off/on 0/1 0 = off, 1 = on.

SPRite — positions as sprite at x,y coordinates.
Format: SYS49664, "SPR" sprite 0-7, x 0-511, y 0-255. Note that some coordinates are off the screen and will will not be visible.

Sprite COlour — sets a sprite's colour.
Format: SYS49664, "SCO" sprite 0-7, colour 0-15 — multicolour off/on 0/1. This last

Can poor Dan decontaminate the atomic fuel rods in time? In this new 3D machine code game, you control Dan Dan The Atomiser Man, jumping him from disc to disc, trying to reduce the ever increasing radiation levels in an atomic pile. However, Up 'n' Atom 'Arry and his gang of vagrant particles are thirsting for the energy in your back pack, which makes life a bit awkward at times. Then there's Ron the Rapacious Robot, not the sort to meet in a dark alley (or anywhere else for that matter)!! As if life isn't difficult enough between each reactor is a hyper-tunnel full of laser traps mutant pac-men and energy pot holes.

(continued from previous page)

BORder — sets border colour.
Format: SYS49664, "BOR" colour 0-15.

BACkground — sets background colour.
Format: SYS49664, "BAC" colour 0-15.

BLAnk — turns screen on or off. The screen should be turned off before using the 1515 printer to prevent a crash, and might also be blanked before a lengthy calculation as running speed is slightly increased when the screen is blanked.
Format: SYS49664, "BLA" off/on 0/1 where 0 = turn screen off, 1 = turn screen on.

SCReen — sets width and length of screen.
Format: SYS49664, "SCR" columns 38/40 rows 24/25.

POSition — sets the x and y scrolling registers. It can be used to move the whole screen up to one character in any direction.
Format: SYS49664, "POS" x position 0-7 — normally 0 — y position 0-7 — normally 3.

CURSet — sets cursor position.
Format: SYS49664, "CUR" x 0-39, y 0-24.0

There are also two functions available. The value in brackets after USR is a dummy argument and does not affect the functions.

JOYstick — reads joystick values.
Format: USR(0), "JOY" port 0/1 where 0 = port 2, 1 = port 1 — switch 0-4 where 0 = up, 1 = down, 2 = left, 3 = right, 4 = fire. The function returns a 0 if the switch is open and a 1 if the switch is closed.

COLlision — detects sprite/sprite or sprite/data 0/1 (sprite — 0, data — 1). The function returns one if the second argument is 0 and the sprite has collided with another sprite since the function was last used. It will also return one if the second argument is one and the sprite has collided with text since the function was last used. Otherwise it will return a zero.

The keywords do not have to be kept to the minimum of three characters. Any number of characters can be enclosed in the quotes as long as the first three letters are those given. Also, the numeric parameters should be enclosed in brackets if they include any calculations. If they consist of just a number or a variable no brackets are needed.

Demonstration

I have written a demonstration game — program 3 which uses the new commands. Look in the listing if you are unsure about how to use any of them.

To add your own commands, first load the existing new vocabulary as normal. Next, load program 2. Now use your assembler or monitor to enter the routine, which should start at the location held in FS$, line 80. The following subroutines should be useful:

$C252 gets an integer from the Basic text and puts it in $A7 and $A8, with the least-significant byte in the accumulator.

$C267 checks that the number in the accumulator is greater than or equal to the number in the X register and less than or equal to that in the Y register. If it is not, the subroutine produces an illegal quantity message.

$C4EC puts the number in the accumulator, which must be 0 or 1, in bit X of the location held in $FD and $FE.

$C7E4: puts bit X of the location held in $FD and $FE into the accumulator.

Saved

When you have done this, change line 80 so that FS$ contains the next free byte after your last routine. Add the first three letters of the new command's name, followed by its start address in hexadecimal, to the Data before line 290. There is room for a total of 64 new commands. Finally, type in direct mode:

FS$ = "(start of free memory, in hex)": GOSUB 3000. GOTO 5040.

The data will now be saved.

Demonstration Game continued from previous page

```
599 END
4000 DX=DX+((X-P-14)/14)*(ABS(DY)/2):DY=-ABS(DY)
4010 SYSYS,"SOU'2,50,1
4020 RETURN
4500 X1=INT((X-24)/8):SYSYS,"CUR"X1,(INT((Y-50)/8))
4510 A$="     ■■■
```

THE FINAL TOUCH

We've just added the final touch to our professional keyboard.
This new Microdrive compatible keyboard offers more key functions than any other in its price range. And the stepped keys and space bar make it even easier to use.
Our keyboard, constructed from high density black ABS, will take your Spectrum into the professional league.
It has 52 "stepped" keys plus space bar. A separate numeric key pad consisting of 12 red keys including a single entry 'delete' plus single entry 'decimal point', facilitate fast numeric data entry.
The 15" x 9" x 3" case will accommodate your Spectrum and other addons like interface 1, power supply etc. and forms an attractive self-contained unit.
All connections, power, Mic, Ear, T.V., network RS232 and expansion port are accessible at the rear.
A few minutes, a screwdriver and the simple instructions supplied are all you need to fit your Spectrum.
All dk'tronics products are covered by a comprehensive guarantee.

Listing continued on next page.

USING INTERFACE 1, it is possible to extend the Spectrum's Basic interpreter and add your own commands — see, for example, the article by Kathleen Peel in February's *Your Computer*. I have discovered another method of doing this which does not use Interface 1, and will work whether or not it is fitted. It can be used on any Spectrum, either 16K or 48K.

The ability to add your own commands can be very useful. It allows you to produce customised versions of Basic for particular applications. For example, you could add extra graphics commands to assist in writing arcade games, or add toolkit routines to help while debugging programs.

Any new command which you decide to use must fail the normal syntax checking in ROM. Two ways of doing this are particularly suitable for this method. The easiest is to use one of the keyword tokens RND to Step as your command. Listing 1, for example, demonstrates Screen$ used in this way. Note that this does not affect the normal use of the token — for example Screen$ as a function.

The other method is to invent new words such as *Renum and *Trade which would need to be typed letter by letter. The "*", or another shifted character, is required to get out of K cursor mode. Just like any other command, your new one could then be followed by a number of parameters — for example *Renum 100,10 might renumber from line 100 in steps of 10.

The program in listing 1 sets up and demonstrates the use of a new command Screen$ which can be used to change the paper and ink colours of the whole screen without erasing its contents. The new command has the syntax:

SCREEN$ paper colour, ink colour(eg. SCREEN$ 5,1)

Listing 1 can be used on both 16K and 48K computers. First type in lines 1 to 21. These lines set up the machine code routine which recognises, checks syntax, and interprets the new command.

The machine-code loader includes a checksum, but even so it is best to Save these lines before you try a Run, because if you have made a mistake in the Data statements the computer might crash. If everything seems OK when you Run these lines, you can test the new command by typing:

SCREEN$ 5,1

as a direct command which should change the screen colours to cyan paper and blue ink. If this works you can now delete lines 1 to 19 before entering the rest of the program. You must leave lines 20 and 21 however, otherwise the new command will not be recognised when you Run the program.

The method for adding new commands is to intercept the error routine which is used by the interpretor when an incorrect command is found. The address of the error routine is the bottom item on the machine stack, and it is pointed to by system variable ERR-SP — address 23613/4. The occurrence of an error (during either syntax-checking or runtime)

(continued on next page)

(Listing 1 continued from previous page)

```
 24 REM  before typing rest of program
 30 REM
 40 CLS : LIST 23:SCREEN$ 5,1
 50 FOR j=1 TO 3
 60 PRINT '"PRESS A KEY FOR COLOUR CHANGE"
 70 NEXT j
 80 FOR j=2 TO 7
 90 PAUSE 0
100SCREEN$ j,0
110 NEXT j
```

causes the following actions from the ROM:

☐ The address reached by the interpreter — system variable CH ADD — is copied to the error pointer — X PTR.

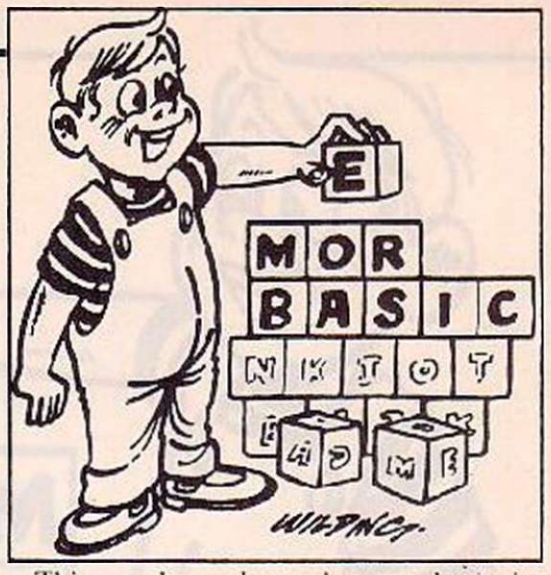
☐ The error code is put into ERR NR. The error code is one less than the report code which is printed after a runtime error. For example, the error code is 255 for report 0 (OK), and is 11 for report C — Nonsense in Basic. An unrecognised command would have an error code of 11 during both syntax checking and runtime.

☐ The stack pointer is loaded from ERR SP, and so it points to the bottom item on the machine stack.

☐ The floating-point calculator stack and memory area is cleared.

☐ The machine code instruction RET removes the bottom item from the stack and jumps to this address. While syntax-checking, this address is normally 12B7 Hex, and causes the offending line to be displayed with a marker at the appropriate position. At runtime, the address is normally 1303 Hex, which halts the program and displays a report message.

By Poking the start address of your machine code routine onto the bottom of the stack, you can divert the error routine. This gives you a chance to find out whether the error was caused by the interpreter reaching one of your new commands. If so, your routine can take over the interpretation of the statement.



This can be understood more clearly by examining listing 2, the disassembled routine for interpreting the Screen$ command used in the example. There are several important parts in this routine which will be useful to you in creating your own new commands.

The first thing to do is to see whether the error code is 11 for Nonsense in Basic. If not, then return to the ROM routine for either a syntax or run-time error after pushing the address of your routine onto bottom of the

RIVER RESCUE

YOU'RE THEIR ONLY HOPE...

...And you don't have to read pages of instructions to get started. It's a fast playable game that's extremely challenging and far from being a pushover.

A team of important scientists have become trapped in a dangerous jungle and their only way out is via the river...

You are the owner of a high power river boat and it's your job to rescue them.

Navigating one of the wildest, most dangerous rivers in the world, you must steer your craft up the winding river, avoiding hazardous islands, crocodiles and floating logs, in your attempt to save lives.

This fast action, high energy game combines a smooth scrolling screen with superb sound and graphics ensuring hours of enjoyment.

(continued from page 134)

stack — it will be addressed by ERR SP ready for the next error.

If the error code was 11, then the error may have been caused by your new command. At this stage, system variable CH ADD points to the character in the line after the one which causec the error. If you command uses one of the tokens RND to Step — e.g., Screen$ — then it is easy to test for the appropriate code. If you choose new keywords which are typed letter by letter, such as *Renum, then each character should be individually tested, and CH ADD advanced along the line as you do so by using RST 18H and RST 20H — see table 1. If your new command did not cause the error, then a return to the ROM can be made.

After identifying the command, your routine must make sure that it is followed by the correct number of expressions, and during runtime they must be evaluated. The easiest way to do this is to use the line-scanning routines in ROM — see table 1.

Before calling these, CH ADD must point to the first character of the expression, and afterwards it will point to the character following the expression. At run-time, the value of the expression is put onto the calculator stack.

The final syntax check which must be made is to ensure that the last character of the

(continued from page 136)

statement is Enter or a colon. CH ADD should point to this character, otherwise the Basic interpreter will be upset when you return. If syntax-checking, the return can now be made after resetting the stack.

At runtime the command can now be executed. The start address of your routine is replaced on the bottom of the stack, and a jump back to the ROM made.

Any number of new commands can be added to the interpreter using this method. Each one will need its own syntax-checking and runtime routine. If you want to try this for yourself, the example in listing 2 will give you an idea of what is involved.

After writing your machine code routine, it can then be loaded into memory. The best place to put it is above RAMtop, using the Clear command to reserve some space for it. Before your new command(s) will be recognised, you must Poke the start address to the machine-code routine onto the bottom of the stack as in lines 20 and 21 of listing 1.

Similar Pokes must be included at the beginning of any program which uses your extended Basic. Although your routine should replace its start address onto the stack each time it is called, the Run command has the effect of clearing the stack and returning the normal error address. The Pokes are needed in the program to overcome this.

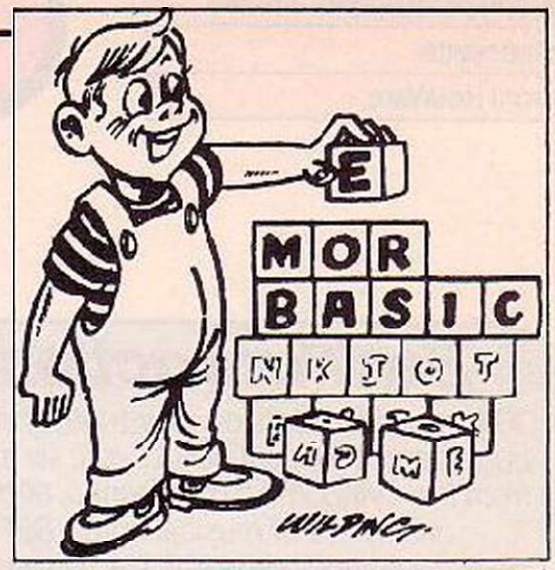

Table 1 continued from page 136.

	calling this routine, and afterwards it points to the next character after the expression. If the expression was numeric, bit 6 of system variable FLAGS is set (reset for a string).
1C7A	Evaluate two numeric expressions, separated by a comma and put values onto calculator stack if runtime. CH ADD and FLAGS as for 1C82.
1E94	Take number off calculator stack and put into the accumulator. The number must be positive and less than 256.
1E99	Take number off calculator stack and put into BC. The number must be positive and less than 65536.

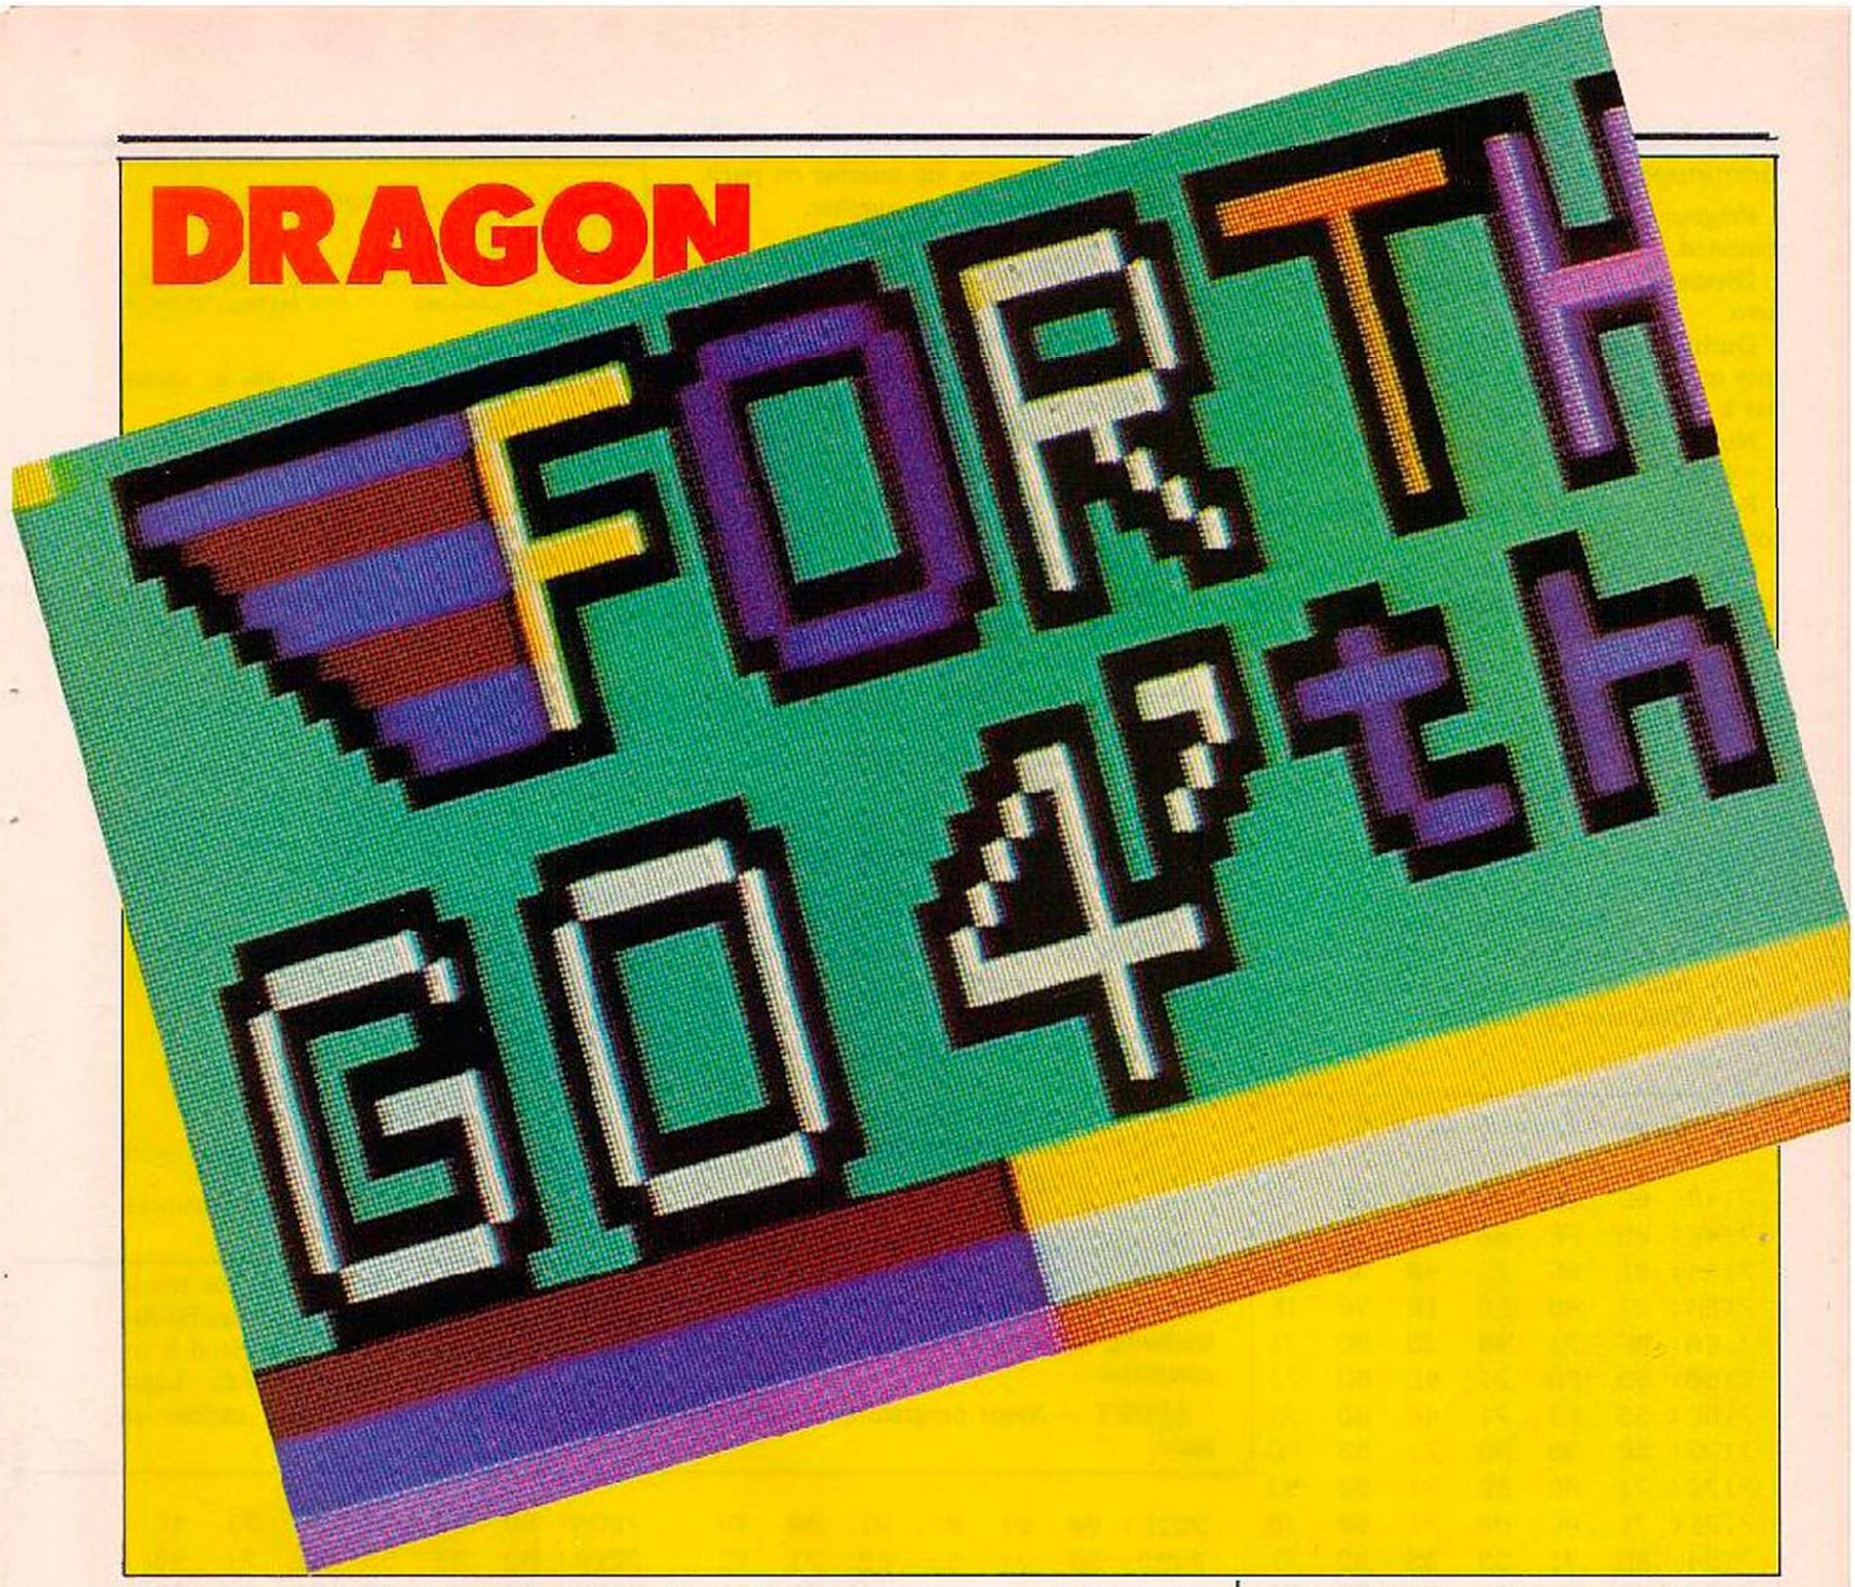
DRAGON

FORTH



THIS PROGRAM IS Dragon Forth for the Dragon 32/64. As many people have read articles in back issues of *Your Computer* I will not explain the fundamentals of the language although I will explain my implementations of the words. Although the compiler is slow, once compiled programs will run up to 50 times as fast as Basic.

Typing it in is quite a task but if you have time you will be well rewarded. First you type in the Basic program then save it and autorun i.e., Goto 1210 — line 1240, if included in your programs, will make it autorun.

Next you type in the machine code or assembly code if you have DASM. Once this is done and checksum matches then save it after the Basic compiler. If you leave a big space between the Basic and machine code then that would be safer. To save the machine code use

CSAVEM'F WORDS',29000,30100,34010

The compiler and Forth is well error checked so it is just about impossible to crash it unless you use USR or Exec.

Some of the following errors may occur during execution:

Loops Not Nested — Do Loop; Repeat Until; Begin While loops not nested or Exit without Do-Loop.

continued from previous page

Program Aborted — Abort has been executed.

Divide By Zero — Attempt to divide by zero.

During compilation the following errors may occur — Undefined Word — Attempt to use a word that is not in the dictionary.

Number Too Big — Number >65535 or <-32767.

Bad Line — A programme line has been incorrectly entered.

Bad Variable — Variables other than A-Z have been used. The following is the system commands:

is >32767 then is is printed as a negative.

CLEAR — Clears all stacks.

*VLIST — List dictionary,

*LIST — List out source definitions,

*SAVE — Save all words and definitions to tape,

*LOAD — Load back into computer.

*DEL — Clear source buffer

*RESET — Restarts the program.

These are explanations of the core words:

+ — Adds top two numbers on the stack.

- — Subtracts top numbers.

DROP — Removes top number on stack.

DUP — Duplicates top number.

* — Multiply top numbers.

EMIT — Prints character whose ASCII value is on the stack.

Prints top number on stack. If the number

SWAP — Swaps top two numbers on stack.

OVER — Duplicates the second number.

= — As basic test leaves 1 if true and 0 if false.

<,<>,> All as =.

AND — Logical And.

OR — Logical Or.

EOR — Logical Exclusive Or.

? — Single byte Peek.

@ — Double byte Peek.

? — Single byte Poke.

?+ — Double byte Poke.

EXEC — Calls machine-code routine.

PRINT/PRINTOFF — Turns on/off printer.

USR — As Exec but returns value in D — Register.

KEY — Gets a keypress. 0 if no key pressed.

GET — As key but waits for a press.

$ — Prints a string of letters I.E. 'HELLO' $.

/ — Divides top numbers on stack.

DO . . LOOP — As FOR . . NEXT loop.

EXIT — Premature exit from DO LOOP.

LOOP — As loop but with step.

IND — Loop counter.

REPEAT . . UNTIL — as in beeb basic.

BEGIN . . WHILE — As REPEAT UNTIL.

IF — Tests flag on stack. If true it does following commands else jumps forward two commands.

ABORT — Stops program and returns to basic.

EMPIRES

When a Galactic war breaks out, there is only one winner — make sure it's you!

Empires is a game of the type which has not been seen before. It is a fully player interactive strategy game for up to six players and an umpire. The basic set contains three players. Expansion set one contains three more. Each player controls a unique race struggling to take over the galaxy. Mining companies, space fleets and sound strategy all contribute to the success of your race; but beware the other players will be trying to tear your empire apart. The skill required to organise your empire as it grows is enormous. To assist you galactic maps and data cards are provided. Soon further expansion sets will be available to give you an advantage over the other players. Move information is transferred via cassette to the umpire who analyses it with his program and returns the new data to the players. Messages can be sent to other players in the same way.

THIS IS A NEW CONCEPT IN STRATEGY GAME PLAYING.

48K SPECTRUM

CONTENTS: THREE PLAYER CASSETTES, ONE UMPIRE CASSETTE, 4 GALACTIC MAPS, 81 DATA CARDS, 1 FULL SET OF RULES, 3 PLAYER INSTRUCTIONS

Price £19.95.

COLECO ADAM Competition RESULTS

FANS OF DOUGLAS Adam's book and TV series, the *Hitchhiker's Guide to the Galaxy*, will know it starred a computer named Deep Thought. In answer to the Ultimate Question about the Meaning of Life, the Universe and Everything Deep Thought came up with the number 42. This also happens to be the solution to May's Coleco Adam Competition.

42 is the maximum number of shapes you can touch on in sequence taking 41 steps to do so. There are two routes through the puzzle grid which give this figure. One is shown here. The other is almost the same except for a variation over two steps.

Well over 1,000 people entered the competition. Quite a few of them put their computers to the task of finding the solution. A look at the times their programs took to run through all variations throws an interesting light on the relative speeds of different machines and languages.

On the ZX-81 one program took three days before it found the answer. A more efficient version on the same machine cut the time down to 10 hours while on the BBC micro the job took six hours.

Several Spectrum owners used the popular Hisoft compiler to write programs in Pascal which checked all the routes in around two hours.

Pride of place, however, must go to the two entrants — one from Poland — who wrote their programs in machine code. These made swift work of the problem, coming up with the answer in just over two minutes.

In view of the number of correct answers — 130 of them — we awarded the prize on the basis of the tie-breaker. Competitors were asked to complete the sentence, "With arcade fun and word processing in one . . ."

Wit seemed in short supply this month and most people were content simply to carry on the rhyme. The best in this line were A. Taylor's "an Adam I'd treasure for both business and pleasure" and P. Holdsworth's "amusement's respected whilst words are perfected".

Alan Whitfield, however — of 48 Cambridge Avenue, Marton, Middlesbrough, Cleveland — found inspiration in the Garden of Eden. His was judged to be the winning entry: "an Adam would have enlightened Eve more than an Apple". On the same theme A. Wood suggested "If Eden had Adam would Eve even consider the Apple".

Other entries deserving of a mention were P. King's "Adam plays when work is done" and from D. Sinfield who expressed his feelings about Coleco's cabbage Patch dolls with "nice computer — shame about the doll".

What the competition hasn't been waiting for.

Latest version of Forth for the BBC (Is not rehashed Forth 79 Code)

Unique Stack Display Utility

16k Eprom type 27128

Multi-tasking operating system for Real-Time use.

Here's the Forth Eprom for the BBC Micro that makes all others out of date.

It's Multi-Forth 83 from David Husband who has built his reputation for Quality Forth products with his ZX81-Forth ROM, Spectrum Forth-I/O Cartridge and now New Multi-Forth 83 for the BBC Micro. This is not rehashed Forth 79 Code, but a completely new version of the Forth 83 Standard. It's unique in that it Multi-tasks, and therefore the user can have a number of Forth programs executing simultaneously and transparently of each other.

Multi-Forth 83 sits in the sideways ROM area of the BBC along with any other ROMs in use. It is compatible with the MOS, and specially vectored to enable a system to be reconfigured. It contains a Standard 6502 Assembler, a Standard Screen Editor and a Unique Stack Display Utility.

With this Forth, David Husband has provided the BBC Micro with capabilities never before realised. And being 16K rather than 8K is twice the size of other versions. Multi-Forth 83 is supplied with an extensive Manual (170 pages plus) and at £40+VAT it is superb value.

Order it using the coupon adding £2.30 p&p (£5 for Europe, £10 outside) or if you want more information, tick that box instead. Either way, it will put you one step ahead of the competition.

Please send me Multi-Forth 83 for BBC Micro £40 + VAT. Deluxe System inc. Disc £80 + VAT.
Cheques to Skywave Software. Readers' A/C (or enter Visa No.)

- ☐ Spectrum Forth-I/O Cartridge

Skywave SOFTWARE

CheetahSoft
Soft we're not

FOR SPECTRUM 48K

CONQUEST

CONQUEST A tactical game which even veteran players will find both challenging and rewarding.

Mediterranean Europe is divided into grid squares. Your aim, as Emperor, is to gain 100 squares of territory as quickly as possible – at the same time dealing with Barbarian counter-attacks, plagues, civil war and rival Emperors.

5 levels of skill, plus a continuous 'Conquest' game where all the difficulty levels are thrown in together.

3D BAT ATTACK An all action, 3 dimensional maze game where you gather up blocks of gold, at the same time pitting your wits against vicious vampire bats whose only purpose in life is to locate, hunt and kill you.

4 levels of skill. At each level the game gets faster and more complicated, and the vampires more dangerous.

CheetahSoft
Soft we're not

FOR SPECTRUM 48K

3D BAT ATTACK

AFTER THESE, THE REST IS KIDS STUFF.

Are you ready for CheetahSoft? There's only one way to find out. But be warned: these vampire bats know a good meal when they see one. And our friend with the scythe has had years of experience . . .

So don't play unless you're ready to play the game for real. Because you'll find there's one sure thing about CheetahSoft: Soft we're not.

£6.95 at all good stores.

CheetahSoft
Soft we're not

RESPONSE FRAME

Do you have a problem? Your manual is incomprehensible or you just cannot get the hang of that programming trick you tried — whatever it is, Tim Hartnell will do his best to answer your queries. Please include only one question per letter and mark them "Response Frame".

CBM-64 BUGS?

☐ **I have recently acquired a Commodore 64, and have two queries about it. The first is that when the cursor-right key is used and then followed by cursor-up in quick succession, a spade — shifted A — is left at the point of change. The second is that when the operation FRE is used, I get a number in the region of −26,000. I have found that if this number is added to 64,000 then a number in the correct region is gained, although my old Vic-20 directly printed up the number of bytes free. Are these bugs in my computer?**

A W Duncan,
Barns Park, Cramlington.

ONE IS A BUG, and one is just a fact of Commodore 64 life. The spade is due to a bug — common to all Commodore 64s — either in the Basic or the operating system. It seems that FRE on this computer can return either the number of bytes left, or a negative number. It depends on the circumstances in which the command is used. That is, on what the computer has been doing immediately prior to you using FRE. If the number is positive, then that is the number you use. If it is negative, add this number to 79,360 — 64 times 1240 — to obtain the answer you want.

6502 INFO

☐ **Would you kindly advise of any publications dealing with 6502 assembly language, and machine code, which could be used in conjunction with the BBC model B for the purpose of writing programs in these languages?**

B V Dukinfield,
Poynton, Cheshire.

PERHAPS THE best general guide to 6502 is Rodnay Zaks' *Programming the 6502*, Sybex. BBC-specific books you might find helpful are:

Beginner's Guide to Assembly Language Programming on the BBC Micro — Ross Symons

Discovering BBC Machine Code — Stephenson

Assembly Language Programming for the BBC — Ian Birnbaum

6502 Assembly Language Programming — Leventhal

Assembly Language Programming for the BBC Micro — John Ferguson and Tony Shaw

STRING POSITIONS

☐ **I have a 48K Spectrum and want to work out anagrams on my computer. Please could you tell me how I can simulate Mid$, Left$ and Right$ using the Def FN function, as these are in the program I wish to use, but are not on the Spectrum keyboard.**

Guy Westgate,
Shaftesbury, Dorset.

MID$, LEFT$ and Right$ are the Microsoft Basic means of obtaining parts of strings. Nearly all computers with Basic use these. The Sinclair computers are the exception. You cannot use Def FN to simulate these, and I am sure that you would not want to do so, even if you could. All you need to do is understand what the Microsoft commands do, and then you can easily substitute the Sinclair string-handling commands for these. Mid$ is used to extract a portion of a string. Mid$(A$,3,2) takes two characters from the string A$, starting at the third character. The Sinclair equivalent is A$(3 to 5). Left$ also takes bits of a string, but starts at the left-hand end. This means that Left$(A$,2) would take the first two characters of A$. A$(to 2) is the Sinclair equivalent. Right$ does the opposite of Left$, stripping characters from the right-hand end of the string. Therefore, Right$(A$,2) in Microsoft Basic is A$(Len(A$) — 2 to).

SAVE PROBLEM

☐ **I have been quite proud of my ZX-81, but now I have a Sinclair 16K RAMpack I have problems. With the RAMpack fitted, I find that Saved programs do not Load. Listening to the sound track, I can hear a humming interference on top of the usual noise pattern. Since my tape-recorder is a good one, and the problem does not occur without the RAM pack, I am pretty sure it is the pack which is causing the problem. If so, is there anything I can do about it?**

Stephen Boyles,
Woking.

IT SOUNDS AS if you have just bought your RAM pack. If this is so, take it back to the place you bought it from, explain the problem, and get a new one. If you have had the pack for some time, and this solution is not realistic, I suggest you borrow a RAMpack from a friend, and see if the same problem occurs. If it does, it sounds as if the problem is the computer. If not, it is your RAM pack which is faulty. In this case, I suggest you replace it.

PERIPHERALS

☐ **I own a Sinclair Spectrum and would like to add a modem, disc drive and a printer/plotter capable of using standard stationery. Is this a practical proposition, or would I be better off using another manufacturer's computer as the base of such a system?**

Paul Seward,
Kilkhampton, Cornwall.

I GUESS IT would be possible, but you would have a pretty ugly mess of interfaces and the like. I would forget the idea of starting with a Spectrum. The set-up will never be as satisfactory as it would be if you started off with another machine. The BBC model B may well be worth considering for this.

VIC ASSEMBLER

☐ **I am a Vic-20 owner and wish to delve into machine code. Could you, therefore, advise me as to the best way to go about this? I realise I need an assembler, yet how do I use it? Is that all I need? Which is the best and most reasonable assembler to buy?**

A Jones,
Northwood, Merseyside.

THE FIRST STEP is to buy a good book on learning machine code on your Vic-20. Some books actually include an assembler. Commodore sells a cartridge called Vic-Mon for programming in assembly language.

BEST DISC DRIVE

☐ **I am planning to buy a BBC model B with disc drives, and while waiting for my savings to reach the necessary amount, I am trying to find out what is the best to buy. Buying the computer itself is not so much of a problem, but when it comes to the drives, I really cannot see the forest for the trees, and would therefore be very pleased if you could give me some advice. I am looking for at least 200K — 400K would be better still — compatibility with Acornsoft disc-based software, maximum reliability and a price-tag not exceeding the £375 mark, including cables, etc. What should I buy? If it is not possible to answer my question specifically, could you then perhaps tell me what to look for?**

Joachim Fleury,
Amsterdam.

YOU HAVE IN fact, already gone some way to answering your own question. The advice I tend to give when asked "which . . . should I buy", be it a Pac-man implementation or a computer, is for the prospective purchaser to make a list of (a) the "must have" requirements, which usually includes the price, and particular features which are vital; and (b) the "would be nice to have" requirements. Then I suggest working through *Your Computer* magazine advertisements for a start to make a shortlist of products which meet the "must have" requirements. From this, it is usually fairly simple to find one product which also supports the "would be nice to have" list. Joining one or more machine specific users' clubs — such as Laserbug or Beebug, in your case — is also a good way to learn, at least, which products to avoid. User club publications tend to be more scathing in their treatment of unsatisfactory products than magazines aimed at a wider audience.

INPUT INIGMA

☐ **Michael Maloney writes from Islington in north London: I was interested to see J H Weaver's letter — Response Frame, *Your Computer*, January — as I have had the same problem with the Input statement using the Microsoft Basic Compiler. The MBasic Interpreter will return a null string if Return is entered in response to the input prompt, but the compiled version prints "Redo from start" and forces re-entry on the next line. This error cannot be trapped by the On Error Goto statement and makes the Input statement useless for serious applications.**

One way round this is to use the CP/M Bdos call for string input and I have enclosed a short 8080 routine that does this. It can be assembled with the Macro-80 assembler and incorporated in the system library — BASLIB.REL — as follows:

```
M80 IN,IN = IN
LIB NEWLIB = BASLIB,IN
PIP BASLIB.REL = NEWLIB.REL
```

Any program using it can then be compiled and linked normally.

```

VIC-20 UDGS

☐ **I own a Vic-20 and have written a few games for it. Since the graphics from the keyboard are not particularly exciting, I would like to know how user-defined graphics are accessed and used.**

Mark Deaville,
Milton, Stoke-on-Trent.

I AM AFRAID I cannot answer that question in a few lines. It would take an article that would run to several pages in this magazine. Creating user-defined graphics is covered in detail in the book *Beyond Simple Basic — Delving Deeper into your Vic-20* by Philip Campbell. The *Vic-20 User Guide* also covers the subject.

Find out why YOUR COMPUTER is Britain's biggest selling computer magazine — subscribe today!

Forget the crowds clamouring at the newstands to buy the latest copy of Your Computer; forget that frustrated feeling when you discover the last copy in your newsagent has been sold. Instead take some positive steps to avoid disappointment.

Take out a year's subscription to Your Computer today and enjoy the privilege of receiving your favourite home computer magazine every month in the comfort of your own home. **Simply fill in the form below and return it to the address stated, today.**

SOFTWARE FILE

Software File gives you the opportunity to have your programs, ideas and discoveries published. We will accept contributions for any home computer provided they are submitted to *Your Computer* exclusively. Please double-check your programs and specify the memory they require before sending them, preferably on cassette. We pay between £6 and £36 for contributions published.

Traffic Control

Nick Hockaday,
Shepherd's Bush,
London.

SPECTRUM

THIS PROGRAM FOR the 48K Spectrum puts you in charge of traffic in a busy city centre. It presents you with an aerial view of a number of city blocks; traffic is shown moving in all directions. Your job is to ensure a steady flow of traffic by controlling the lights at the intersections. Jams are quick to build up so you will have your work cut out. Full instructions are given in the program.

Stuntman

BBC

S. Bradshaw

STUNTMAN IS A GAME where you become a stuntman and you have to jump over cars on a motorbike.

Your motorbike starts off in the top left corner of the screen and you control its speed across and down the screen. There are six levels on each screen with a jump with varying numbers of cars on each. It does not matter if you jump too far over the cars, unless there is a tunnel after a jump. After the jumps with tunnels you must land just after the cars in order to go straight through the tunnel.

You start with three motorbikes and lose one every time you crash, and the game ends when you have none left. You score five points for every jump and a bonus for finishing each screen. There is also an extra bonus for of a hundred points for finishing five screens.

The program takes up about 3.4K but it uses Mode 1 which uses 20K. The program was written for the model B but it could easily be converted to run on Model A in Mode 4. The instructions procedure is unimportant and could be missed out or changed. To omit the procedure delete lines 60, 540 and 550, change line 520 and change line 530 to

REPEAT UNTIL INKEY (– 99):CLS

VIC-20

THIS PROGRAM WAS written on an expanded Vic-20 — 16K — and features the spinning outline of a 2 inch cube, depicted in outline as a wire skeleton, so all the edges are seen simultaneously.

Written in machine code, the program rapidly projects successive images of the cube in 3D on the screen, giving the illusion of movement. The speed of rotation may be slowed down, or increased with the aid of the function buttons F1 and F7.

As regular users of an expanded Vic-20 will know, the presence of the extra 16K brings about a rearrangement of the various memory locations, including that of the screen. Before this program can be Run, it is necessary to set aside an area where one can store the machine code, without fear of it being overrun with Basic. This is done by running the short program entitled "Re-arrange Vic-memory" every time the computer is first switched on. This moves the start of Basic to 8192, and reserves the section from 4096 to 7679 for machine code.

As described in the Commodore Programmers' Reference book, the screen address has now been moved to 7680. This program should be saved for future use, before being Run. After being Run, it is automatically erased from memory, having done its job.

When the Basic program is first Run, the lines 2000-2015 Poke the Data values into the area reserved for machine code. Data values in Lines 20-28; 29-35; 36-44 and 45-52 contain information essential for drawing the various shapes of the cube. Data values in Lines 1000 to 1005 are concerned with the machine code control program.

The program is directed to the machine-code program by the various SYS values in Line 4001. Once the Control part of the machine-code program has been invoked, this loads the various line values into the accumulator and Stores them in the relevant positions. Lines 4005-4012 control the speed of rotation.

It is very important to Save the program, before RUNing it, in case errors have been introduced and it crashes. Nothing is more frustrating than to spend some time typing in a lot of values and then losing the lot.

For those not interested in machine code, the Basic program supplied will set up all the parameters and the program will Run without trouble. For machine code enthusiasts, further information is supplied by the "Disassembler Analysis of Rotation Control" print out. The Control part of the machine-code program which lies between 6000-6090 decimal (1770-17D2 Hex) has been analysed by a disassembler program.

Listing speed

S.A. Sassoon,
Long Stratton,
Norfolk.

CBM-64

THE COMMODORE 64 lists at such a fast speed that it is impossible to read each line as it scrolls onto the screen, even while the Ctrl key is held down. This routine enables the function keys to control the listing speed.

Once the program has been run, holding down the f1 key while a program is being listed halts the display, enabling the lines to be examined. Holding down the f3 key during listing causes the display to be slowed down — characters being printed on the screen one at a time.

(continued on next page)

(continued from previous page)

This is extremely useful for checking complicated Basic lines such as data statements. As an extra bonus, it will also reveal any Basic lines that have been hidden with delete characters.

The speed of the slow listing depends on the value Poked in line 30. This can be altered if required — values of 230 to 255 give best results.

This extension to the Basic list routine is written in machine code which is Poked into memory from the data statements. This means that after running it can be newed and the listing controls remain effective on any further programs which are entered or loaded.

DRAGON

THIS PROGRAM EQUIPS the Dragon with a screen editor, a valuable programming aid with many uses including modification of the program line sequence and line concatenation.

The machine code is relocatable and uses the character-input RAM hook at address $.6A.

```

Type in the program and save it in case of a crash, then run it. Line 80 provides a checksum which should detect most errors in the data. When all is correct, the Exec statement in line 90 sets up the RAM hook. Once the program is debugged, you can add a New command to line 90 so that the program clears itself.

The editor is installed now but it is not active, and the Dragon behaves just like normal, though you cannot use the right-arrow in your programs. To invoke the editor, press the right-arrow key, whereupon the cursor should stop blinking. Using the arrow keys, the cursor can be positioned anywhere on the screen. Note that the keyboard auto-repeats if a key is held down.

Once the cursor has been placed over the first of a set of characters to be copied, pressing the Clear key will run the cursor along the line, copying the characters as if they had been typed. Characters may be inserted by moving the cursor off the line, typing the new characters and moving back onto the line.

The up-arrow character may be obtained using shift up-arrow. To delete a character once it has been copied, type shift left-arrow. Once the new line is complete, it can be entered by typing Return as usual. This also exits from the editor.

Back-up

D N Venamore,
Burgess Hill,
Sussex.

ZX-81

THIS COPIER for the 16K ZX-81 will duplicate any program up to 15K long including those which cannot be Saved by the normal routine.

The program is a modified version of the ZX-81 Load and Save routines and comprises 128 bytes of machine code and a supporting "no-frills" Basic program. It fits into 1K with a little to spare.

The program to be copied is loaded above RAMtop, from where it can be saved as required.

Before typing in anything,

POKE 16389,72

and New. This sets RAMtop to 18432, which allows sufficient space to enter and edit the program, but is low enough to collapse the Display File. If this is not done the expanded Display File will be saved with your completed program, making it too long to Load into the 1K finally allocated for it.

Load or type in your favourite hex loader and create a Line 1 Rem statement with 128 characters of your choice.

If your hex loader starts at Line 10,

POKE 16419,10

If not create a dummy Line 10 — 10 Rem will do — and then

POKE 16419,10

Load the machine code — listing 1 — into the Rem statement and check it. Note that the first two bytes of machine code prevent the rest of the machine code listing in the Rem statement.

When the machine code is loaded in,

POKE 16510,10

The Rem statement should now be Line 0. This cannot be accidently deleted.

Now delete all lines excepting Line 0 and 10, and enter the remainder of the program — listing 2 — overwriting the previous line 10.

Save the program a couple of times before proceeding.

The program in the computer cannot be Run in its present state because RAMtop is too high.

It is necessary then to clear the program from memory, reset RAMtop to 17408 and reload the program.

I prefer to set RAMtop using the short program in listing 3.

I keep this on tape in front of the Copy program with approx. 10 secs of tape running between them.

Whichever you prefer, enter New. Set RAMtop using the RAMtop program or

POKE 16389,68

Now reload Copy and run it.

The first prompt asks for the name of the program to be copied. Note that the name is not used to find the named program on the tape.

After entering the name and Newline, the next prompt appears, "Start Tape the New Line".

Audibly monitor the program to be copied and locate the start of the 5 second silent period which precedes the program proper. Stop the tape there. Then with the recorder set for Load, start the tape and press Newline immediately.

When the program is Loaded, the prompt

"Loaded-Start Blank Tape then Newline to Save" appears. Place a clean tape in the recorder set for Save, run tape and press Newline.

When the program has Saved, the option to take further copies is presented. The Break key may be used to abort both Load and Save routines.

After Break, Run will return you to the Load routine. Goto 180 will return you to the Save routine.

Learning Tree

D.J. West

WRITTEN IN Basic for the 16K, Learning Tree asks you, the user, questions about an object you are thinking of, which you answer True or False by pressing T or F until it guesses the correct object or a false one.

It starts by asking you to input the names of two objects and a difference between them from which it forms the questions it will ask. This is the first branch of a tree of knowledge which builds up as you teach the computer the names of new objects and their differences.

By calling the Menu you can Save and Load trees of files which you have created, or start a new one.

When running the program Caps Lock is On, ie., the cursor should flash C.

Program structure is as follows:

Line	Function
0-90	Initialise.
100	1st branch.
200-300	Plain loop, question and answer.
900	Enter unknown object.
1000	Modify tree routine.
2000	Word-wrap routine.
2500	Load tree.
3000	Save tree.
4000	Menu.

Airbrush

Robert Graves,
Hanwell,
London.

BBC

AIRBRUSH IS NOT another sketchpad routine. The problem with those is that they lay colour too thickly and too uniformly in neat straight lines — leaving the finished artwork looking just like its been drawn on a computer. Airbrush, however, allows colour to be built up on an area, laid randomly in a fine spray of colour. The size of the area over which you spray can vary from a single pixel's width — giving a performance similar to the sketchpad program on the Welcome tape — right up to approximately half the screen.

The results are much more realistic than usual, as shading is now possible, the colours achieve an un-computerish "texture" — though higher resolution graphics would achieve this even better — and, with care, even a certain amount of colour mixing is possible.

Unfortunately, this version doesn't allow for pictures being saved or stored for later use, and it can only be used with a joystick. The procedure "j-scan" could easily be modified to work with the cursor keys, though, and any occurrence of "Adval(o)" throughout the program replaced with a line looking for, say, the Return key.

UDG * 8

Brian Cooper,
Lytham,
Lancashire.

SPECTRUM

MACHINE CODE BUFFS must be on the increase. Regular readers of *Your Computer* will know that published programs become more and more sophisticated. But, while machine code makes for faster action, the beginner will find it difficult to follow how the routines work and entering pages full of numbers is not a pleasant prospect. Instead of hours typing in strings of data in read statements, this is the program to turn creation of User Defined Graphics — UDGs — from a chore into a game, with a guarantee of perfect results. And not just single characters.

The program provides a grid which enables up to eight UDGs to be worked on together — ideal when a composite figure is needed — and continuously show the results. Unlike the single character grid on the Spectrum Horizons tape, with this program characters can be seen relative to each other as the UDG set is built up. Any single pixel can easily be changed.

Two groups of eight UDGs make a string of sixteen characters which are then copied away to a separate area of memory, to be followed by as many further sets as are ever likely to be wanted. Any one of these sets can then be called back and used at will, and all can be stored on tape.

This program incorporates a number of features which may provide instructive examples to the new programmer. Though written in Basic and therefore easy to follow, the program is reasonably quick in operation and makes full use of the system variables relating to UDGs.

Almost every Spectrum owner will know that each character comprises an eight by eight matrix of dots or pixels. UDGs can be entered one "line" at a time as bytes from USR 'A' to USR 'R' + 7. The program works by holding the line being worked on in the form of a string, for example

BIN 10101011

and this is constantly updated from an array which monitors the grid as the program progresses.

The numeric value of the string is continuously Poked to memory, and the

graphics set printed out with letters grouped in various useful combinations to show the effect actual size at the bottom of the screen.

All this happens quite quickly — the main subroutine is near the start of the program in lines 6020/30 to keep time to a minimum.

The complete program can easily be incorporated in a larger program and some of the subroutines may be useful. For example, the various sets stored away are called up by the lines from 6450. This is achieved by Poking successive values into 23675/6 — UDG: see page 175 of the manual — to point to the first character of the set.

Matrix Run

Johan Berge, Norway.

DRAGON

SURVIVOR IS A fast-moving matrix game. It runs on a Dragon 32/64 and is written entirely in Basic. It is actually the same game as Matrix Run published in *Your Computer* October 1983, written by Russ Whitehead.

I was amazed of the superior Boolean algebra in this game, and therefore I converted it to my Dragon 32. Necessary instructions are contained in the following program.

```

ORIC

THIS PROGRAM IS a machine-code renumberer which was written on a 48K machine. The program will renumber any size Basic program. It has been designed to renumber the whole of a Basic program of lines not greater than 64000. However it will handle Goto, Gosub, Then and Else and On Goto/Gosub commands.

After typing in the Basic program, which Pokes the machine code, it should be Saved as a Basic program so it can be checked later, if necessary. After Saving the Basic type Run. Now type New and CSave

CSAVE "RENUMBER", A #9A00, E #9D40

This now Saves the code directly.

When you want to renumber a Basic program type

HIMEM #99FF

and

CLOAD" "

the machine code.

Now two variables have to be set. The first is at which line number the Basic will be renumbered and the size of increment between each line. An example of this is:

DOKE #400,(NEW STARTING LINE OF PROGRAM)

DOKE // 402, (INCREMENT)

To get the machine code going call # 9AC0. As it is a machine code renumberer it is very fast and even the largest of program take a very short time to renumber.

Although I wrote the program on a 48K machine I see no reason why it should not work on a 16K machine.

DRAGON

LOW-RESOLUTION Animator is a program I have written to produce short animated sequences of graphics on the Dragon 32 micro. The frames are entered one by one using a graphic design program, saved in memory and then animated by machine code. The program is very easy to use, although designing 40 or so frames of a cartoon can take some time.

First, the frame must be drawn out on the screen. The graphics design program is controlled by the arrow keys moving a small flashing cursor around the screen — owing to the limitations of the low resolution graphics mode, the cursor will turn the whole block it is in to white if it is moved against a coloured background, but it will return the block to its orginal colour when moved away. The system has three modes of operation:

PLOTTING MODE — Graphics are entered by pressing a number key from 0-8, which sets the pixel under the cursor to that colour.

FOLLOW MODE — This is accessed by pressing F and then a number key. When in follow mode, the cursor will leave a trail behind it in the colour corresponding to the number key pressed when follow mode was accessed. To leave follow mode, press any command key apart from the arrow keys.

TEXT MODE — This is accessed by pressing T. It enables you to type in text — for captions, speech bubbles, etc. — starting at the cursor position. To leave this mode, press the down arrow. The caption had better be kept on for several frames if it is to be easily read.

To finish a frame and to save it in memory, press S. The screen will not be cleared in case the next screen is only slightly different from the last. If the screen needs clearing, press C and enter a colour. When the sequence is finished, press Enter and the computer will provide an animated display of your frames by flicking through them rapidly. If the speed is

too great, or the program does not provide enough time for your sequence, add a delay loop at line 715 to slow it down.

The program works by calling a machine code routine to copy the low-resolution screen up into higher memory. Every frame is stored in the memory above the program and when the Enter key is pressed to animate the sequence, the program runs through all these by calling a similar machine code routine to move it back again down to the low-resolution screen.

It would have been possible to animate to pictures even faster by simply altering the screen start location — FFC7hex to FFD3 hex — in the SAM, but unfortunately, in the older Dragons, this doesn't seem to work above 4000 hex (16384 decimal). Anyway, this provides more than adequate speed of animation copying memory from one place to another.

Program Scanner

Don Scarrott,
Workington,
Cumbria.

SPECTRUM

WHEN DEBUGGING a program, you often need to know where and how a particular variable is used. It is very difficult to be sure you have identified every occurrence yourself, so I tried to write a Basic program to do the search for me. It worked, but was dreadfully slow, taking some 10 minutes to scan a long program.

This machine-code version is much shorter, and is as fast as the normal listing. It scans the program lines, skipping Rem and Data lines, rushing past anything between quotes, jumping over the embedded numbers, converting upper to lower case, and comparising names to what you have placed in z$. If they match, that line is printed.

The machine code is located at 63929 with a length of 291. To use it you merely set the variable name into z$, and Randomise USR 63292. It will then list all the lines containing that variable on the screen.

To enter the machine code, first type in the hex loader from figure 1, and Run it. Figure 2 shows a column of decimal addresses on the left, and four columns of hex on the right.

Enter the first address from figure 2, and then the blocks of hex, one after the other. Each block contains its own check digit, so if it is wrong, it bleeps and expects you to enter it again.

(continued on next page)

Figure 3

```
8691 REM Progan Prompter
8692 CLEAR 63928
8693 LOAD "PROGAN3" CODE
8694 INPUT "Z$ ";Z$
8695 PRINT : PRINT "Lines contai
ning ";z$
8696 RANDOMIZE  USR 63929
8697 GO TO 8694
8698 SAVE "progan"
8699 SAVE "PROGAN3" CODE 63929,2
91: STOP
```

(continued from previous page)

You only have to enter one address at the beginning, but do check that the ones on the screen correspond to those in the figure, in case you miss a line. If you do miss something, run again from the last correct line

When you want to get out of the loop, delete the first quotes and enter Stop.

When it has been entered correctly, you may like to take a backup copy by entering

SAVE "PROGAN" CODE 639 29, 291

You can test it at this stage by:

"LET Z$ = "b":RANDOMISE USR 63929: PAUSE 0"

However, for convenience, you can prepare a prompter tape as follows.

New, and type in the prompter program from figure 3. Put a fresh tape in the recorder and Goto 8698 to save first the Basic program and then the machine code. You may like to verify them before proceeding.

Load your target program, enter

MERGE""

and start the prompter tape. Stop it as soon as the Basic part has loaded. Enter

Goto 8692

and start the tape again. When the code has loaded, the z$ prompt should appear. Enter the variable name of interest, and watch the lines scroll up the screen.

If you want hard copy, get out of the loop by deleting the quotes and entering Stop. Then enter:

OPEN #2,"p"

and

Goto 8694

to re-enter the loop.

```

Merge Command

William Fong,
Charlton,
London SE7.

CBM-64

ONE OF THE MAJOR drawbacks of Commodore Basic is that it has no merge command like the Spectrum. I have written a program which will compensate for that; it simulates the Merge command.

When you have typed the program out do not run it until you have a copy saved on tape. This is because the program may crash if a mistake has been entered. When all is ready Run the program and the screen should go black and "Ready" will appear. This program is situated above the RAM in which you use so it will not crash with your programs. You now may load your programs.

However, you do not use the command Load but

SYS 40705 "PROGRAM NAME IF YOU KNOW IT"

This is used instead of Merge because the Basic interpreter will not recognise this command.

Remember that the programs which you intend to string together must have different line numbers or lines will overlap each other. Also each separate program will be listed in blocks and not among themselves, but they still will run as one complete program.

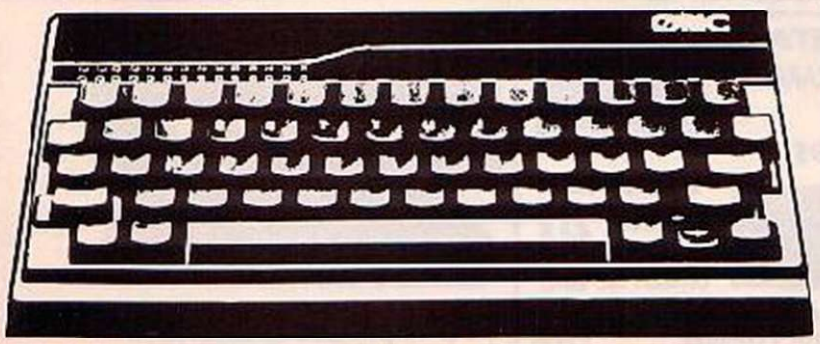
ALPHACOM 32 For ZX SPECTRUM ..... Spectrum Price **£59.95**
Paper Rolls for Alphacom printers
Box of 5 Rolls **£6.00**

ORIC ATMOS



The ATMOS has taken a remarkable step forward in home computer technology!

Most Micros use memory on functions like graphics, colour and sound. Oric saw that by running these tasks from ROM memory, a huge amount of the ATMOS's valuable 48K RAM could be freed.

So the colour capability (8 graphics, 8 background), powerful sound synthesis and high-resolution graphics of the ATMOS are achieved with fewer demands on computing power than its competitors.

So what else makes the ATMOS so exciting? There's now a typewriter-style, full-response keyboard; it's directly compatible with most domestic cassette players; and there's a wide choice of software. The ATMOS is designed for convenience, too – it uses extended Microsoft BASIC; your printer plugs in without an RS232; and it comes complete with leads and everything you need to get going.

We've a four-colour ORIC printer (which accepts normal paper) at a terrific value-for-money price Soon, a 3-inch Microdisk Drive will be available, too, to complete the system. Take a look at the superb new Oric ATMOS, at your Spectrum dealer now!

- Lots of exciting programs available
- Built-in centronics printer interface (no RS232 needed - just plug in your printer)
- Full-featured keyboard with sculptured keys
- Seperate keys for cursor control
- Built-in speaker
- Special sound effects for game programmers

SPECTRUM PRICE
£169.99

STACK LIGHT RIFLE

Available for the SPECTRUM, VIC-20, and the COMMODORE 64 (Arriving Now!), comes complete with 14 feet of cable and three exciting action software games including "HIGH NOON SHOOTOUT" with full sound effects.

The Key To Success!

Now, with the new Stonechip Spectrum Keyboard, the user has no worry of damaging the Spectrum itself as improved designing enables it to fit the case perfectly.

Assembling the case is simple as it consists of two halves. the top half containing the keyboard, with a small printed circuit board, attached by ribbon cable, plugging into the rear of the Spectrum. The lower half fits precisely around the Spectrum, thus preventing any risk of damaging through movement.

Your Sinclair guarantee need not be invalidated since the Spectrum does not require removal from its case.

THE MAIN FEATURES OF THE KEYBOARD ARE:

- ☐ No modifications to Spectrum necessary as it connects via rear port.
- ☐ Full-length space bar.
- ☐ Built-in 'Echo' amplifier and tape interface.
- ☐ RESET keys remove the need to disconnect power supply lead.
- ☐ Single key 'DELETE'.
- ☐ Single key 'Extended Mode' selection (ie one key replaces the CAPS SHIFT and SYMBOL SHIFT function).
- ☐ Fully compatible with Interface 1 and most peripherals.

COURSEWINNER

The Punters Computer Program

COURSEWINNER allows you to use the power of your computer to get the edge on the bookmaker.

- COURSEWINNER contains a database full of detailed information on all English and Scottish flat courses. The ten leading jockeys and trainers, and effect of the draw is detailed for each course. This information can be displayed on the screen at any time.
- The program analyses these factors combined with the results of the last three outings, starting price and weight carried.
- COURSEWINNER is simple and quick to use, yet very powerful.
- Boxed with detailed instruction booklet.

Price £12.50 all inclusive IMMEDIATE DISPATCH (RETURN OF POST)

Available for:
SPECTRUM (48K), BBC (B), COMMODORE 64, DRAGON, APPLE II/IIe, ATARI (48K).

POOLSWINNER

The Ultimate Pools Prediction Program

- POOLSWINNER is the most sophisticated pools prediction aid ever produced. It comes complete with its own massive database.
- Can be used for Scoredraws, Draws, Aways and Homes.
- The database contains over 20000 matches (10 years league football). It updates automatically as results come in.
- The precise prediction formula can be set by the user. This allows development of your own unique method.
- Package is complete with program, database and detailed instruction booklet.

Price £15.00 all inclusive IMMEDIATE DISPATCH (RETURN OF POST)

Available for: SPECTRUM (48K), ZX81 (16K), BBC (B), COMMODORE 64, DRAGON, APPLE II/IIe, ATARI (48K).

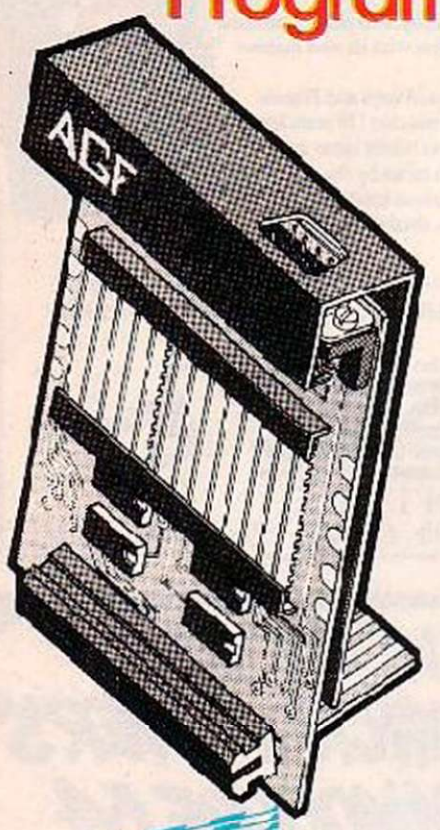
AGF

JOYSTICKS

SPECTRUM

INTERFACES

Programmable Interface



Hardware programmed, this interface attains Joystick or Trackball compatibility with ALL Spectrum or ZX81 software.

Without internal memories or tapes to load the direct addressing mode offers the fastest computer response to controller movement with programming being retained when the power is off.

Eight directional capability is automatically achieved by just setting up, down, left and right.

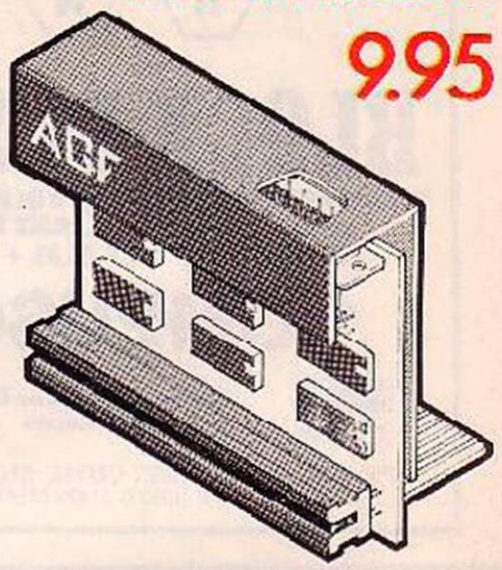
The hardware approach is totally compatible with all key reading techniques unlike memory programmed devices.

Supplied with Quick Reference Cards, to speed up setting to your favourite games, demonstration cassette and twelve months guarantee.

26.95 plus £1 post & packing

Interface II

9.95



Now the AGF Interface II is even better value. Since we pioneered the cursor-key interface in October 1982 there are now over 100 games or utility programs with either the AGF option or cursor key controlled – that makes it unbeatable at this new low price.

Still incorporating the all important rear expansion connector which means other peripherals can be connected at the same time (ie Ram Packs, Printers, Speech Units etc.) and of course the key replication principle used guarantees this will never conflict electrically with any other add ons.

NEW

RomSlot

Now is your chance to enter the growing world of instant loading games.

All ROM Cartridge software can be keyboard controlled so a joystick is not essential.

Only high quality programs are available on ROM and soon a whole new range is to be launched by Parker Games exclusively on cartridge, for the Spectrum.

RomSlot's unique 'Game Restart' will restart the game at any time during play. When no game cartridge is in use this becomes a useful computer reset facility from crashes or conventional machine code programs.

RomSlot is fully compatible with all other add-ons via a rear connector and is cased and fully guaranteed for twelve months.

only 11.95 plus 50p post & packing

A NEW WORLD OF ADVENTURE

BLACK CRYSTAL

BLACK CRYSTAL
A THIRD CONTINENT SERIES ADVENTURE

The Classic, six program adventure game for the 48K Spectrum and 16K ZX81 computers. No software collection is complete without it. "**Black Crystal** an excellent graphics adventure and a well thought out package." *Sinclair User April '83* "**Black Crystal** has impressed me by its sheer quantity and generally high quality of presentation. I am afraid, I have become an addict" *Home Computing Weekly April '83*
Spectrum 48K 180K of program in six parts only **£7.50**
ZX81 16K over 100K of program in seven parts only **£7.50**
WHY PAY MORE FOR LESS OF AN ADVENTURE?

CRYPT

THE CRYPT by Stephen Renton

Prepare yourself for the many challenges that shall confront you when you dare to enter **THE CRYPT.** You will battle with giant scorpions, Hell spawn, Craners, Pos - Negs and if you are unlucky enough — the Dark Cyclops in this arcade style adventure.

Available for the 48K Spectrum at £4.95

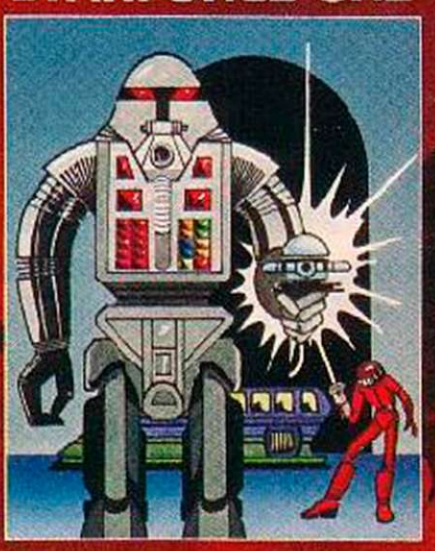
ADVENTURES OF ST. BERNARD

THE ADVENTURES OF ST. BERNARD

An exciting, fast moving, machine code, arcade game where you guide your intrepid St. Bernard through the perils of the icy wastelands to rescue his Mistress from the clutches of the abominable snowman.

Available for 48K Spectrum £5.95

STARFORCE ONE

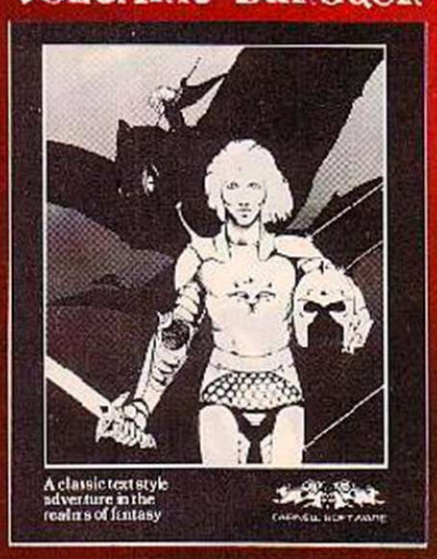


STARFORCE ONE

Take on the robot guardians of the central computer in a superbly stylised three dimensional battle game.
(100% machine code arcade action)

Available for 48K Spectrum £5.95

VOLCANIC DUNGEON



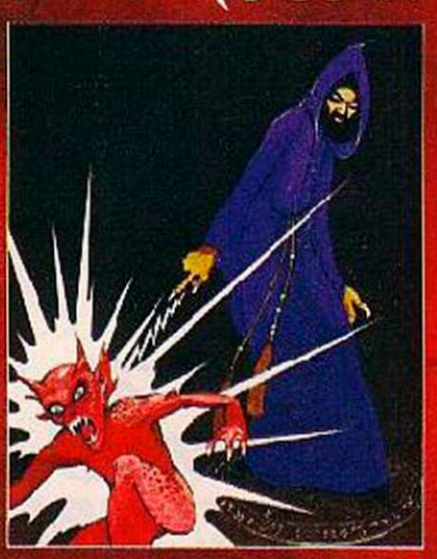
VOLCANIC DUNGEON
A THIRD CONTINENT SERIES ADVENTURE

Enter the realm of Myth and Magic in this classic Fantasy Adventure. Battle with Magra and her Evil Allies to rescue the Elfin Princess imprisoned in a Crystal Coffin Deep within the Volcanic Dungeon. Random Dungeon set ups ensure that you can play this addictive adventure over and over again. Single key entry cuts out tiresome typing associated with other Text Adventures. Instruction Manual with Map of Dungeon enclosed.

"The whole game mechanism makes for a very Addictive Program and one that remains a firm favourite with many Adventurers."
Popular Computing Weekly, June 1983

For the 48K Spectrum or ZX-81 16K @ £5.00

DEVIL RIDES IN



THE DEVIL RIDES IN

I uttered the last incantations as the clock struck thirteen. All fell silent except for a faint rustling in the corner. From out of the shadows they came, all Hell's fury against me but I was not defenseless until the Angel of Death, astride a winged horse, joined the battle. Avoiding his bolts of hell fire, I took careful aim. My chances were slim, but my luck held.

(Fast moving, machine code, all action, Arcade game)

Available for 48K Spectrum £5.95

The above are available through most good computer stores or direct from:

DEALERS: Contact us for your nearest wholesaler

FROM CARNELL SOFTWARE

"THE WRATH OF MAGRA" A THIRD CONTINENT SERIES ADVENTURE

The first born has been destroyed. The Black Crystal of Beroth has been banished. The alliance of Evil has been defeated by the armies of Lord Fendal. So ends the Third Age. Now we invite you to write your name in the history of the Fourth Age of the Third Continent.

You will meet friends and enemies, old and new, in the long awaited sequel to Volcanic Dungeon. Using high resolution graphics and combining the best qualities of "Black Crystal" and "Volcanic Dungeon" we will allow you to become part of this tale of revenge.

"The Wrath of Magra" comes as three 48K programmes on cassette, boxed with instruction manual and book detailing the history of the Third Continent and the many spells you will be using throughout the game. For the 48K Spectrum @ £12.50.

NOTE: "The Wrath of Magra" is a complete adventure. You need not buy "Volcanic Dungeon" or "Black Crystal" to play it.

Available from Feb '84

MAIL ORDER PROTECTION SCHEME

If you order goods from Mail Order advertisements in this magazine and pay by post in advance of delivery, *Your Computer* will consider you for compensation if the Advertiser should become insolvent or bankrupt, provided that:

(1) You have not received the goods or had your money returned; and

(2) You write to the Publisher of of *Your Computer* summarising the situation not earlier than 28 days from the day you sent your order and not later than two months from that day.

Please do not wait until the last moment to inform us. When you write, we will tell you how to make your claims and what evidence of payment is required.

We guarantee to meet claims from readers made in accordance with the above procedure as soon as possible after the Advertiser has been declared bankrupt or insolvent.

This guarantee covers only advance payment sent in direct response to an advertisement in this magazine not, for example, payment made in response to catalogues etc., received as a result of answering such advertisements. Classified advertisements are excluded.

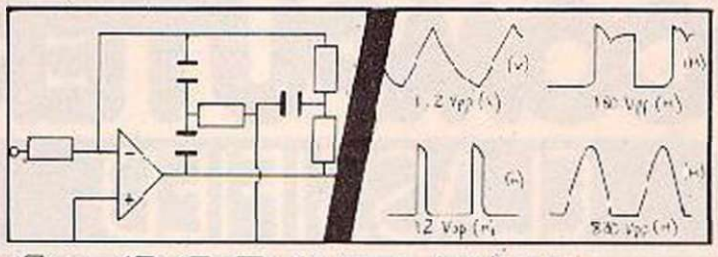
ENFIELD HOUSE
SWARDESTON
NORWICH
NORFOLK



ELECTRONICS £ 9.95

DIGITAL CIRCUIT DESIGNER. Electronics allows you to draw your circuit diagram on screen using standard symbols for logic gates, transistors, resistors, capacitors, diacs, triacs, diodes, etc. etc... Symbols can be rotated, wiring interconnected or crossed over as required. Once complete the computer will 'power up' your circuit - high voltage levels turn red, low levels turn green. Circuits can be de-activated, modified and re-activated until they function as required, all without touching a soldering iron! Part completed circuits may be saved for future work and displays can be sent to the printer. All components are fully interactive i.e. they can change the state of actions previously performed in the sequence - even oscillators can be seen oscillating. Warning is given of short-circuits. 65 defined graphics are employed.

LINNET £ 14.95

LINEAR NETWORK ANALYSER. Characteristics of complete networks, including sub-circuits, are entered. The computer performs either time or frequency domain analyses, presenting the output data in any of a choice of forms, both graphical and written. The program detects the presence of a printer and, if connected, can produce detailed graphical displays by printing lengthways along the paper. Happily deals with highly complex networks - the instruction book provides numerous examples using transistors, I.C.s, bandpass filters, op amps, etc. etc... An invaluable tool for both professional and amateur designers.

48K SPECTRUM

Data to your Commodore and music to your ears

THE ROTRONICS DR2301
AUDIO/DATA CASSETTE RECORDER

• Why should you need two cassette recorders just because you are a Commodore user?

• The ROTRONICS DR2301 has all the facilities you would expect of a quality audio recorder and also works perfectly with the VIC 20 and CBM 64 computers without any fiddly separate boxes or adaptors. Simply connect the DR2301 directly with your Commodore computer via the lead supplied and you are ready to start. The built-in interface circuitry ensures that SAVEing and LOADing is completely reliable – even when using commercially produced software. The DR2301 also allows the computer to sense when the PLAY key has been depressed.

• Additional features are auto-stop, tape counter, inbuilt microphone and foldaway carrying handle. The DR2301 is also compatible with the ZX81, Spectrum and many other popular home computers.

• The DR2301 will take its power from the computer (Commodore only), mains adaptor (supplied) or internal batteries. Each unit carries a full 12 month guarantee.

• All this at a price which is a lot less than you would pay for a dedicated data recorder – just £34.95 (p & p £2.00). Send your order form to (no stamp required):

SMT, FREEPOST, Greens Norton, Towcester, Northants NN12 8BR.

£34·95

SUPERIOR TAPE COPIER

We are convinced that the new 007 SPY is the very best Spectrum tape copier available on cassette. Find a better one & TWICE your money back if you find a better copier offering better value.

a. Can copy complete programs all in one go.
b. Can make copies of programs upto 80K long. (Yes, I did say 80K long!)
c. Very simple to use.
d. Has copied all programs we know of.
e. Microdrive Compatible AND includes a program to copy tapes to microdrive.

WARNING: You can buy a cheaper 'Mickey Mouse' copier which copies only one section at a time & has to be reloaded after each. 007 SPY Stays in Spectrum till told to go.

007 SPY is just £3.95. 150

THE HOME COMPUTER RAIL GAME SPECIALIST

DRIVE A TRAIN. We have two games to choose from in our train driver simulation series.

FLYING SCOTSMAN. Drive from Kings Cross to Doncaster in an HST Deltic or Brush 47. Performance of motive power is accurately portrayed within this game. There is plenty of scope for spirited running but watch out for signals.

CORNISH RIVIERA EXPRESS. Step aboard a Class 50, HST or Brush 47 and drive from Paddington to Exeter not forgetting your Reading stop. All your concentration will be required on the Berks and Hants section with its many speed restrictions.

Both simulations contain an end of game performance rating so score well you must keep on your toes.

Simulation available for BBC 'B' and Spectrum 48K.

SPOTTING GAMES for Steam Railway Enthusiasts.

SOUTHRAIL, MIDRAIL and WESTRAIL — Three great games to take you back to travel as it was in the early sixties. Several hundred steam engines to be seen in each game whilst travelling the length and breadth of the region, with well over one hundred stations in each game. Each engine is graphically depicted with name and number. Treat yourself to a fireside railover.

Spotting games are the Spectrum 48K only.

Available from address as above.

All games £7.50 inc. p&p

Ring Michael Rogers on 01-661 3457

LEADERS IN COMPUTER GAMES REQUIRE PROGRAMS AND PROGRAMMERS

1. Original game programs for the Spectrum or Commodore 64 are urgently required: Arcade, Strategy or Adventure. We pay top royalties or tailor a contract to suit your needs — world-wide sales ensure the best possible deal.

2. Programmers to work in 280 or 6502 assembly language for contract work or translation coding — best results.

Phone or write in confidence to:
Software Development
Ocean House, 6 Central Street
Manchester M2 5NS
Telephone: 061-832 6633

LYNX COPY CAT

This is a collection of programs for serious and non-serious programmers alike.
COPY CAT will Load/Save/Verify, with or without auto-run, m/c, basic, and multi-part programs and make security copies at a different speed to the original. Two full disassemblers, DISM at ram top, DISB at the bottom of program ram, so that all of the coding can be examined. BREAK a short relocatable m/c program that activates the 'BREAK' key so that in the event of a program crash, or whilst a program is running, a press on the key will return you to the monitor.

DO IT WITH TRANS-EXPRESS

TAPE TO MICRODRIVE — MICRODRIVE TO TAPE

Would you like to transfer your Spectrum programs from
① MICRODRIVE TO MICRODRIVE ③ TAPE TO TAPE
② TAPE TO MICRODRIVE ④ MICRODRIVE TO TAPE
Then do it with

TRANS-EXPRESS

TRANS-EXPRESS is the most comprehensive package of four m/c utilities for transferring Spectrum programs. They are user-friendly, simple to use, reliable & very efficient. They go much beyond where similar elements failed, enabling you to transfer any kind of programs up to the full 48K length - provided you do not infringe copyright. **TRANS-EXPRESS** is an essential microdrive companion and an invaluable software back-up utility.
We are offering the entire package for **£9.95** or a combination of TAPE TO MICRODRIVE & MICRODRIVE TO MICRODRIVE for **£7.50**. You can also buy each of the four programs separately for **£5.50** only. 224

SPECTRUM and DRAGON TAPE COPIER 5 and now MICRODRIVE 1

WE OFFER ON ALL PRODUCTS A FULL MONEY BACK GUARANTEE, an update service, and FULLY detailed instructions, with USER friendly programs. Match that!

TAPE COPIER 5 (TC5) makes BACK-UP copies of ANY type of SPECTRUM (16/48K) program (incl headerless, m/c, unstoppable) easily with MANY unique features.

MAXIMUM 5 STARS from H.C. Weekly just like GRAPHICS and SOUND TOOLKIT — £5.50).

- LOADS in all program parts CONTINUOUSLY — even without pressing a key. Other copiers require many loadings — MASSIVELY saving you time and trouble! Maxbytes even manages a working copy of the full 48K.
- M/Drive — this extra option GENUINELY copies BASIC, M/CODE + arrays onto MICRODRIVE.
- Verifies. Repeat copies. Auto. Abort. Program name plus HEADER data.
- Copies virtually ALL programs. UPDATE service for old customers, to keep pace with latest developments £1.50 (£2 with m'drive) + SAE + old TAPE.

MICRODRIVE ONE (MD1)

48K Spectrum owners with m/drive can NOW transfer the MAJORITY of their programs (inc headerless, long programs, + those with LOW addresses — say 16384).

TC5 transfers the bytes, but MD1 has 5 programs to HELP YOU get them running + 2 "CAT" housekeeping programs. Includes advanced header reader, program analysis, and other programs that produce the m'code you need. Manual has examples/exercises. UNRIVALLED!

Spectrum T.Copier £4.50 (or £5.50 with m/drive option), Dragon Copier £6.99, Microdrive One £6.50.

OVERSEAS customers: add £1 Europe, £2 others for each product. Please send SAE for enquiries.

LERM, DEPT YC, 10 BRUNSWICK GDNS, CORBY, NORTHANTS.

SUPER BREAKER

For the COMMODORE 64, this utility will back-up most popular cassette programs onto Tape or Disk. Also now available a TAPE TO DISK UTILITY for transferring cassette software onto Disk. Both are supplied with full written instructions on a data cassette and both priced at just £4.99 each. For a fast turn round of orders, by First Class Post, Bush Cheque/P.O., or SAE for details, to:

Clark Kent Software
26 North Cape Walk,
Corby, Northamptonshire.

BROTHER HR-5 printers (Centronics & RS232) £149.90, Imagine games £3.95, 48K Spectrums £119.90, Quickshot II joysticks £9.50. Pay Computec, 135-137 Glasgow Road, Glasgow G69 6TA. Telephone: 041-771 0074. VAT included. P&P free.

VIC TAPE BACKUP will backup most Vic-20 programs, in BASIC, machine-code, or both. Detailed instructions are printed on the card inlay. VIC Tape Backup is easy to use, with prompting by colour and by sound — when the colours change and the tone sounds, the copier is ready! Load errors are signalled, so poor originals can be tried again. Works with all memory configurations — one machine-language program allows automatically for memory differences! Send crossed cheque/PO for £7.95 to: **Level Software Ltd, PO Box 55, Shirley, SOLIHULL B90 4SL. Tel: 021-643 6728.**

NAME .....

ADDRESS .....

ORIGINAL programs urgently needed Oric and Commodore 64. Educational or Games. Cash payment or royalties. Professional ethics strictly adhered too. Send your program for consideration. Knight Products (UK) Ltd., 71 Colne Road, Earby, Lancashire BB8 6XL. 267

ZX81 M-CODE GRAPHICS 3-D TRACER. Objects display & print XYZ coordinate realy C.A.D. Cass + manual only. £5.95 cheque payable to Dany Hladky, Krimmer Strasse, 10 D-6050 Offenbach-M/W.G. Trade enquiries welcome (IMP-EX) 296

The Publishers take all reasonable care to ensure that classified advertisements are genuine, but readers must satisfy themselves that they will be obtaining what they require before entering into transactions, particularly if they involve large sums of money.

COMMODORE 64 AND VIC 20 PROGRAM COPIERS

They copy most cassette based BASIC, machine code and multi-part programs of any size. Both copiers are written in machine code. Programs using a range of protection techniques can be copied easily. Audio and visual prompts are used for easy operation. Full instructions are contained in the programs.

VIC IMITATOR £6
IMITATOR 64 £6

Please state which is required and make cheques/POs payable to IAN WAITE.

Send orders to:
IAN WAITE, Dept YC,
11 Hadleyarrow Road,
Sheffield, S8 8AU.

POOLS PREDICTION

Made easy on 48K Spectrum. Outputs best draws, homes and aways. Features analytical draw finder which allows program to learn from it's own mistakes, however small comes with free permutation calculator program.

134 dividends won by writer so far. ("This is the best and most scientific of any program I have ever seen" Mr Rap Secretary, Orpington Computer Club).

British Pools.....at £8.95
Australian Pools.....£8.95
Flat Racing.....£19.95

FLAT RACE PREDICTOR

Very successful race predictor for the flat racing season. No knowledge of racing required.

Dept. YC, BOMBEST, 9 Hawkstone Avenue, Newport, Salop, TF10 7SE

SUPERIOR TAPE COPIER

We are convinced that the new 007 SPY is the very best Spectrum tape copier available on cassette. Find a better one offering better value for money, and TWICE your money will be refunded.

a. Can copy multipart programs all in one go automatically.
b. Can copy a genuine 48K long program.
c. Genuinely the easiest copier to use.
d. Has copied all programs we know of.
e. Microdrive Compatible AND includes program to transfer tapes to your Microdrive AND they'll work.
f. Post free even to Europe.

007 SPY IS JUST £3.95

ZX-GUARANTEED (Dept YC)
29 Chadderton Drive, Unsworth, Bury, Lancs. Tel. 061-766 5712

CLUD. Follow your favourite soccer teams with your 48K Spectrum. Enter the scores every week and the league table is updated automatically with full amendability. Scores categorised by team or date and an excellent predictions option. Send cheque/PO for £4.95 to Roygbiv Software, 4 Sunderlands Avenue, Sawston, Cambridge CB2 1TU.

CO COLUMN listing paper, plain or M/R — buy in bulk and save — box of 2000 sheets £14 (inc. p&p). Cheques or P/O to: S.J.F. Enterprises, 9 Chiltern Road, Maidenhead, Berks.
